Executive Summary

A Tier 2 high wind dust event caused particulate pollution levels to exceed the level of the PM_{10} NAAQS at the 2ZV monitor in Bernalillo County on June 19, 2024. The Albuquerque-Bernalillo County Air Quality Program (AQP) has documented this event and provided sufficient evidence based on the requirements of the 2016 Exceptional Events (EE) rule in this demonstration. The AQP requests that EPA exclude this PM_{10} violation from regulatory decisions.

As the camera images in the report show, this dust storm impacted the Albuquerque area. Both the cameras and the remarks in the KABQ weather observations show the blowing dust was widespread. However, based on monitoring data, it appears that Albuquerque's South Valley was hit hardest with dust. High winds developed in the afternoon of June 19, 2024 and continued through most of the evening, resulting in high PM_{10} levels at the 2ZV PM_{10} monitor.

The National Weather Service (NWS) issued a High Wind Warning for the Middle Rio Grande Valley, including the Albuquerque Metro Area, at 0348 MDT on June 19, 2024 and updated it during the day. The high wind warning remained in effect from 1800 MDT that evening to 0600 MDT the following day. Southeast and east winds 25 to 40 mph with gusts up to 60 mph were expected, with the strongest wind gusts below Tijeras Canyon in Albuquerque.

The AQP issued a health alert for Bernalillo County due to blowing dust via an e-mail sent on June 19, 2024 at 1611 MDT. The high winds overwhelmed existing controls causing standardized hourly PM_{10} averages as high as 886 $\mu g/m^3$. The 24-hour PM_{10} average was 264 $\mu g/m^3$.

Unpaved commercial properties and exposed dirt on private properties and road shoulders are identified as likely sources of PM_{10} emissions. The clear causal relationship between the high winds and the PM_{10} levels is established using multiple methods from Table 3 of EPA's April 2016 guidance on preparing EE demonstrations for high wind dust events. The existing mitigation plan and existing controls are also discussed.

EPA's EE rule allows exclusion of qualifying NAAQS exceedances from regulatory decisions, upon EPA approval. Without exclusion, 2ZV data from June 19, 2024 would be a violation the level of the PM_{10} NAAQS.

Therefore, the AQP developed this demonstration as required by the EE rule. The AQP determined that the high winds on June 19, 2024 overwhelmed existing controls and caused the unusually high PM_{10} levels. The AQP requests that EPA evaluate the AQP's assessment and agree to exclude the 24-hour PM_{10} average for June 19, 2024 when making regulatory decisions using the 2ZV data.

Introduction

Jurisdiction and Authority

The Albuquerque-Bernalillo County Air Quality Program (AQP), administered by the City of Albuquerque Environmental Health Department, is authorized to implement and enforce clean air regulations to protect public health within the boundaries of Bernalillo County, excluding tribal lands. The AQP serves as the local agency partner to the Albuquerque-Bernalillo County Air Quality Control Board (AQCB).

The AQP is committed to meeting all federal and state air quality standards and reducing motor vehicle pollution. The AQP carries out the following duties:

- Oversees air quality permitting
- Enforces air quality regulations and permit agreements
- Operates an ambient air monitoring network and quality assures data from that network
- Develops air quality regulations and plans
- Oversees vehicle emissions testing
- Manages an air emissions inventory of all permitted equipment

Bernalillo County contains 1,167.19 square miles. Approximately 334.60 square miles are tribal lands. Excluding tribal lands from the total land area leaves approximately 832.59 square miles, or approximately 71% of the total land area of Bernalillo County, under the jurisdiction of the AQP.

Regulatory Citation

The following is required by 40 CFR § 50.14 - Treatment of air quality monitoring data influenced by exceptional events:

(3) Submission of demonstrations.

i. Except as provided under paragraph (c)(2)(vi) of this section, a State that has flagged data as being due to an exceptional event and is requesting exclusion of the affected measurement data shall, after notice and opportunity for public comment, submit a demonstration to justify data exclusion to the Administrator according to the schedule established under paragraph (c)(2)(i)(B).
ii. [Reserved]
iii. [Reserved]
iv. The demonstration to justify data exclusion must include:
    A. A narrative conceptual model that describes the event(s) causing the exceedance or violation and a discussion of how emissions from the event(s) led to the exceedance or violation at the affected monitor(s);
    B. A demonstration that the event affected air quality in such a way that there exists a clear causal relationship between the specific event and the monitored exceedance or violation;
    C. Analyses comparing the claimed event-influenced concentration(s) to concentrations at the same monitoring site at other times to support the requirement at paragraph (c)(3)(iv)(B) of this section. The Administrator shall not require a State to prove a specific percentile point in the distribution of data;
    D. A demonstration that the event was both not reasonably controllable and not reasonably preventable; and
    E. A demonstration that the event was a human activity that is unlikely to recur at a particular location or was a natural event.
v. With the submission of the demonstration containing the elements in paragraph (c)(3)(iv) of this section, the State must:
    A. Document that the State followed the public comment process and that the comment period was open for a minimum of 30 days, which could be concurrent with the beginning of the Administrator's initial review period of the associated demonstration provided the State can meet all requirements in this paragraph;
    B. Submit the public comments it received along with its demonstration to the Administrator; and
    C. Address in the submission to the Administrator those comments disputing or contradicting factual evidence provided in the demonstration.

Where the State has submitted a demonstration according to the requirements of this section after September 30, 2016 and the Administrator has reviewed such demonstration and requested additional evidence to support one of the elements in paragraph (c)(3)(iv) of this section, the State shall have 12 months from the date of the Administrator's request to submit such evidence. At the conclusion of this time, if the State has not submitted the requested additional evidence, the Administrator will notify the State in writing that it considers the demonstration to be inactive and will not pursue additional review of the demonstration. After a 12-month period of inactivity by the State, if a State desires to pursue the inactive demonstration, it must reinitiate its request to exclude associated data by following the process beginning with paragraph (c)(2)(i) of this section.

Initial Notification

The relevant data for June 19, 2024 were certified by May 1, 2025. The AQP submitted an initial notification letter (see Appendix A) to EPA Region 6 on September 9, 2026. The letter summarizes discussions that took place with the EPA Regional Office prior to formal submittal of this demonstration report.

Air Quality System (AQS) Data Reports

The purpose of this Exceptional Event Report is to request EPA approval to exclude the PM_{10} data from June 19, 2024 due to an exceptional event. Figure 2 shows the 2024 PM_{10} Violation Day Count Report from AQS, which verifies the information provided to the EPA in the initial notification letter. The AQS Raw Data Report in Figure 3 highlights the hourly data from June 19, 2024 that the Air Quality Program seeks to have excluded.

Figure 3: Data from 6/19/24- Exceptional Event Requested for Exclusion

Dust Mitigation

Winds that exceed the high wind threshold, as defined in the Exceptional Event (EE) rule, are more frequent in Bernalillo County during the months of February through May than the rest of the year. The June 19, 2024 event was unusual because it occurred after the typical high wind period. The number of events in Quarter 1 and Quarter 2 increased noticeably from pre-2022 to the three years of 2022, 2023, and 2024 due to the lack of precipitation in the preceding months and seasons.

Table 1 - Event Count 2022-2024

Site	Year	Q1	Q2	Q3	Q4	# of events
35-001-0029	2022	4	5	0	0	9
35-001-0029	2023	2	2	0	0	4
35-001-0029	2024	4	3	0	2	9
3-year event count		3	3	0	2	22

However, based on the three-year event count determined from Table 1, the South Valley air quality monitor (2ZV) meets the recurrence benchmark of three (3) events in three years and is therefore considered as "known seasonal." As a result, a dust mitigation plan was developed by the AQP.

Seasonal trends indicate that exceedances of the PM_{10} NAAQS level are more frequent in the first two quarters of the calendar year (see Table 2).

Table 2: Total High Wind Dust Events from 2011 through 2024

Year	Quarter 1	Quarter 2	Quarter 3	Quarter 4	# of exceedances for year
2011	0	0	0	1	1
2012	2	2	0	0	4
2013	0	0	0	0	0
2014	0	1	1	0	2
2015	0	0	0	0	0
2016	2	1	0	0	3
2017	0	0	0	0	0
2018	2	1	1	0	4
2019	0	0	0	0	0
2020	0	0	1	2	3
2021	0	4	0	0	4
2022	4	5	0	0	9
2023	2	2	0	0	4
2024	4	3	0	2	9
Total per quarter	16	19	3	5	43

20.11.20 NMAC, Fugitive Dust Control

A local fugitive dust control rule, 20.11.20 NMAC, is in place to address fugitive dust control (see Appendix B). Fugitive dust control permits and programmatic permits are issued to potential sources of considerable fugitive dust, and all permittees are required to utilize reasonably available control measures.

Dust Mitigation Plan

On April 26, 2024, the AQP submitted the required Dust Mitigation Plan as a result of EPA findings under 40 CFR 51.930. This plan was submitted after going through the required notice and 30-day public comment period. See Appendix C for EPA's letter, dated July 9, 2024, which confirms completeness of the Fugitive Dust Mitigation Plan.

PM_{10} Emissions Sources

Climate and Lack of Vegetation

Part of the Merriam-Webster Dictionary definition of desert is "arid land with sparse vegetation and receiving less than 10 inches of rainfall per year." Most of Albuquerque receives less than 10 inches of rain annually. The southern part of the Albuquerque metropolitan area receives even less rainfall than north Albuquerque. According to the Western Region Climate Center webpage, Corrales receives an average of 9.91 inches of rainfall annually. Corrales is located in the northcentral part of the Albuquerque metro area.

The Petroglyph National Monument, in northwest Albuquerque, receives on average 9.43 inches of rainfall per year. The Foothills, in far northeast Albuquerque, receives an average of 15.27 inches per year. However, the Albuquerque International Airport in southeast Albuquerque receives only 8.65 inches of rain per year on average.

Figure 4 is an aerial image of the area within about one mile of the South Valley air quality monitor (2ZV). This image is from August of 2024 and reflects the arid climate with a lack of vegetation. The grassy field next to the monitor provides a stark contrast to the lack of vegetation in the rest of the image.

Figure 4: Aerial Image from August of 2024 Upwind/East of 2ZV Monitor

Land Uses and Distance from the River

The local anthropogenic sources of dust near the South Valley/2ZV site include small residential properties and small commercial properties. The residential properties typically provide no ground cover and are comprised of exposed dirt lots with exposed dirt yards and exposed dirt driveways. The commercial properties are similar to the residential properties with no ground cover and consist of small lots of exposed dirt. Several of the nearby commercial facilities include a residence on the property and may often be a combination of private residence and home-based business including junk yards, semi-truck parking yards, pallet recycling, and fire wood storage.

Created with data layers from the City of Albuquerque GIS Department and a Bernalillo County land use shapefile from New Mexico's Mid Region Council of Governments (MRCOG), Figure 5 shows the multiple land use classifications near the 2ZV monitoring site. The lack of vegetation across multiple land use classifications in Albuquerque's South Valley is, in large part, due to the lack of rainfall. Figure 6 shows vegetation all along the river (Rio Grande) that runs from north to south through Albuquerque in stark contrast to the surrounding landscape. If one zooms into the South Valley on aerial imagery taken during the Summer, there are farms close to the river. The water table being close to the surface enables crops and pasture near the river. As one gets away from the river though, vegetation becomes sparse…mainly weeds and desert-adapted plants.

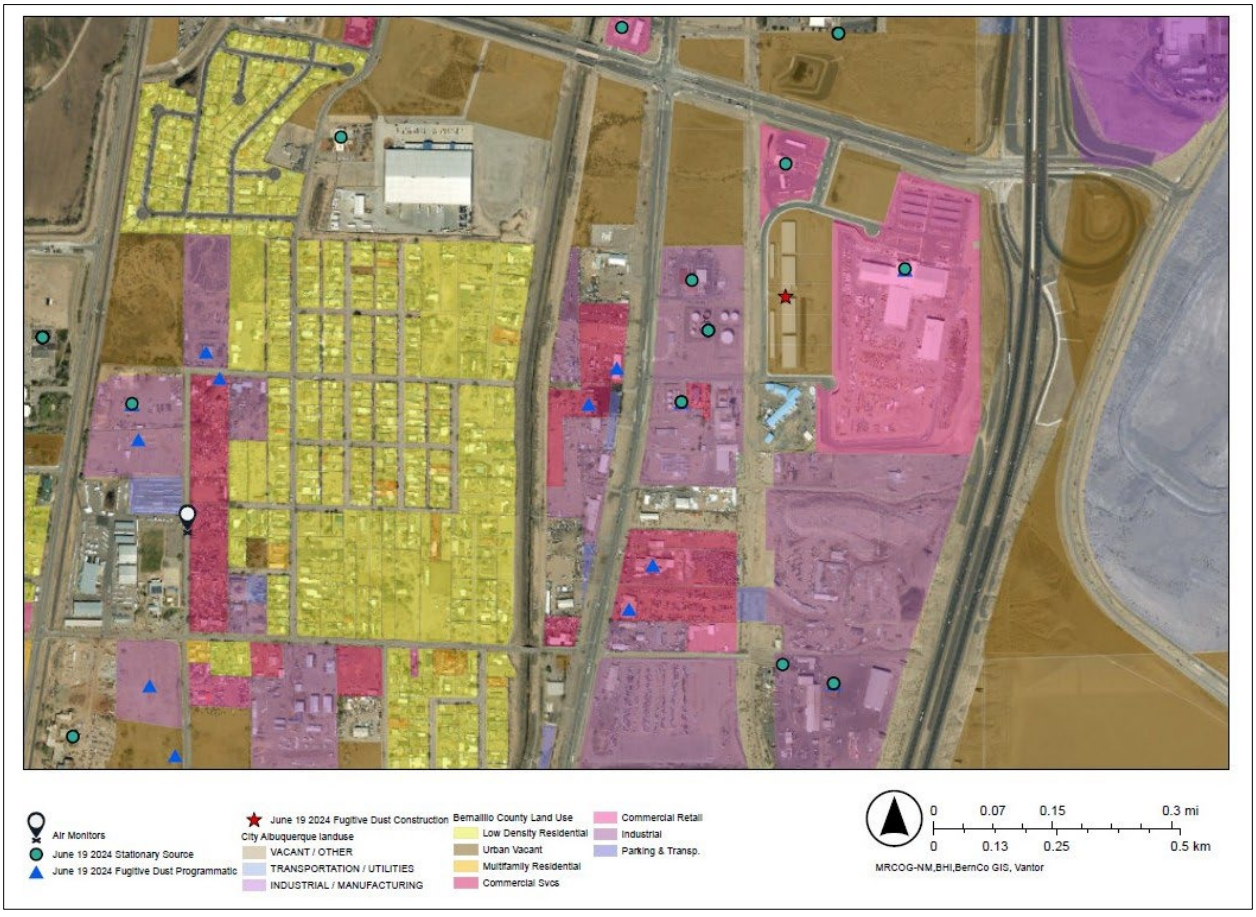

Figure 5: Land Use Upwind of the 2ZV Monitoring Site

Figure 6: Vegetation Decreases Rapidly as Distance from the River Increases

<u>Street-level Views Upwind of the 2ZV Monitor</u>

Images taken at the street-level demonstrate the lack of vegetation in a way that aerial photos can only hint at. Figures 7, 8, and 9 show areas upwind/east of the 2ZV monitoring station. Many properties and road shoulders like this are found east of the 2ZV monitor. Though some properties have fugitive dust control permits, many properties are too small for such permits to be required.

Figure 7: Street-level View Close to the 2ZV Monitor

Figure 8: Street-level View about ¾ mile East of the 2ZV Monitor

Figure 9: Street-level View from about 2.75 Miles East of 2ZV at an Off-road Vehicle Area

Wind Erosion and Soil Erodibility

In April 2006, the Desert Research Institute (DRI) completed a PM_{10} Emissions Inventory report for Bernalillo County for calendar year 2004. This report included some interesting data such as Figure 10, which shows that, annually, 95 percent of PM_{10} emissions in Bernalillo County are due to wind erosion.

Source	PM_{10} emissions (in tons/year)
Mobile sources, on-road	367
Mobile sources, non-road	359
Point sources	593
Wildfires	4
Prescribed burning	9
Residential wood burning	3,907
Structural/vehicle fires	2
Open burn/detonations	73
Charbroiling	478
Agricultural tilling and harvesting	5
Agricultural unpaved roads	24
Construction	6,851
Paved road dust	2,274
Unpaved road dust	1,292
Wind erosion	280,402
Total	296,640

Figure 10: Estimated Annual PM_{10} Emissions by Source Category for Bernalillo County in 2004

Figure 11 (on the following page) demonstrates a characteristic of soils in the Albuquerque metropolitan area that plays an important part in wind erosion; Albuquerque soils have a high degree of erodibility. This is true on both sides of the Rio Grande River, which runs through the Albuquerque metro area in central Bernalillo County. As the legend to the map indicates, the warmer colors on the map indicate more erodible soils; the cooler colors represent less erodible soils.

A great deal of the soil in Albuquerque and Bernalillo County is highly erodible. Due to the lack of rainfall and vegetation, there is a great deal of wind erosion during high winds.

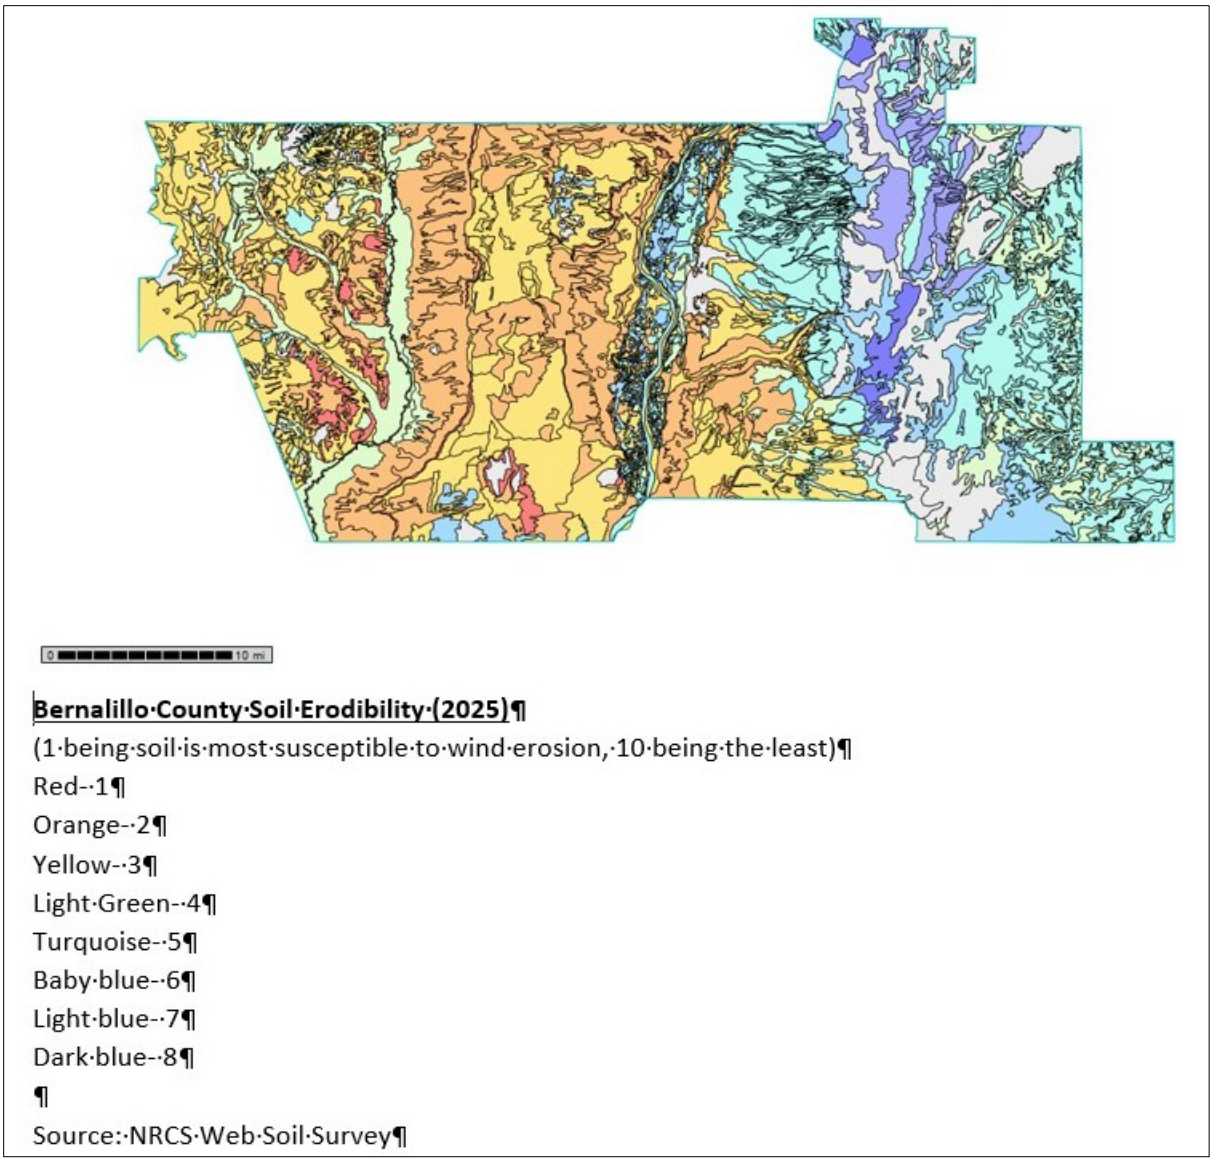

Figure 11: Soil Erodibility Map for Bernalillo County from NRCS Web Soil Survey (using 2025 data)

Narrative Conceptual Model

High Winds

On June 19, 2024, the Albuquerque metropolitan area in Bernalillo County, New Mexico experienced high winds (see Figure 12). The high wind speeds were recorded at the Albuquerque International Airport (KABQ). There were a few hourly weather observations with high wind speeds during the morning hours. By late morning, the wind had calmed down somewhat. High winds developed again by mid-afternoon and lasted through most of the evening.

Figure 12: Official Hourly Weather Data Recorded at KABQ on June 16, 2024

Table 3 simplifies the KABQ weather observations for June 19, 2024 to wind and visibility data. Ten consecutive hourly observations from 1352 MST to 2252 MST reported sustained wind speeds at or above EPA's high wind threshold of 25 MPH. Reduced visibility was reported with eight of those observations.

Weather Pattern

Two changes in the regional weather pattern produced the high winds in Albuquerque on June 19, 2024. One change involved the westward movement of an upper-level high-pressure system. Figures 12 and 13 show the high-pressure system at the 250 millibar (mb) pressure level shifting westward along the Gulf Coast. In Figure 13, the clockwise circulation associated with the high-pressure system is centered near New Orleans, LA at 1200 UTC (0600 MST) on June 19, 2024. Figure 14 shows the same high-pressure system near Houston, TX 12 hours later.

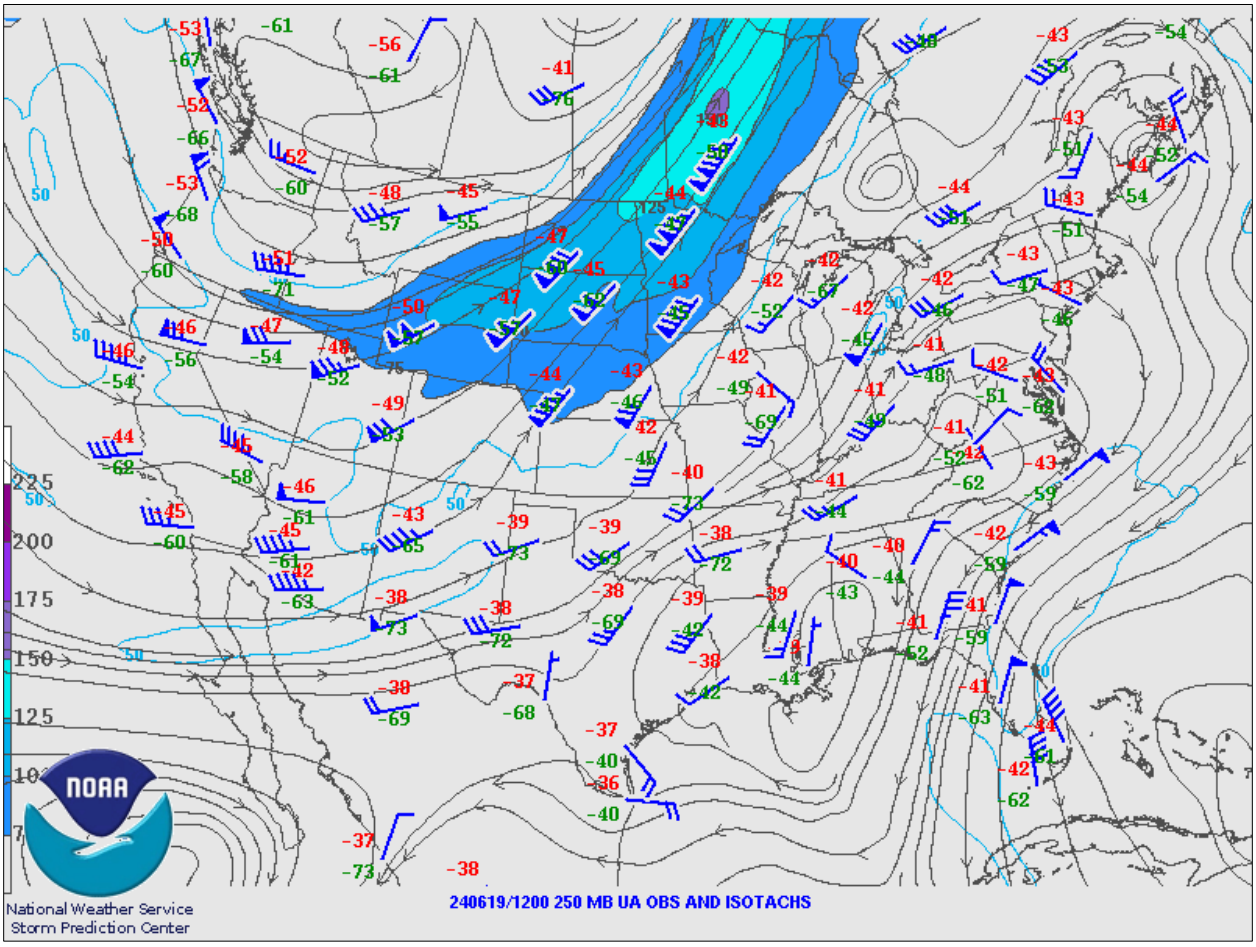

Figure 13: 250 MB Pressure Level at 0600 MST, 6/19/2024 (1200 UTC, 6/19/2024)

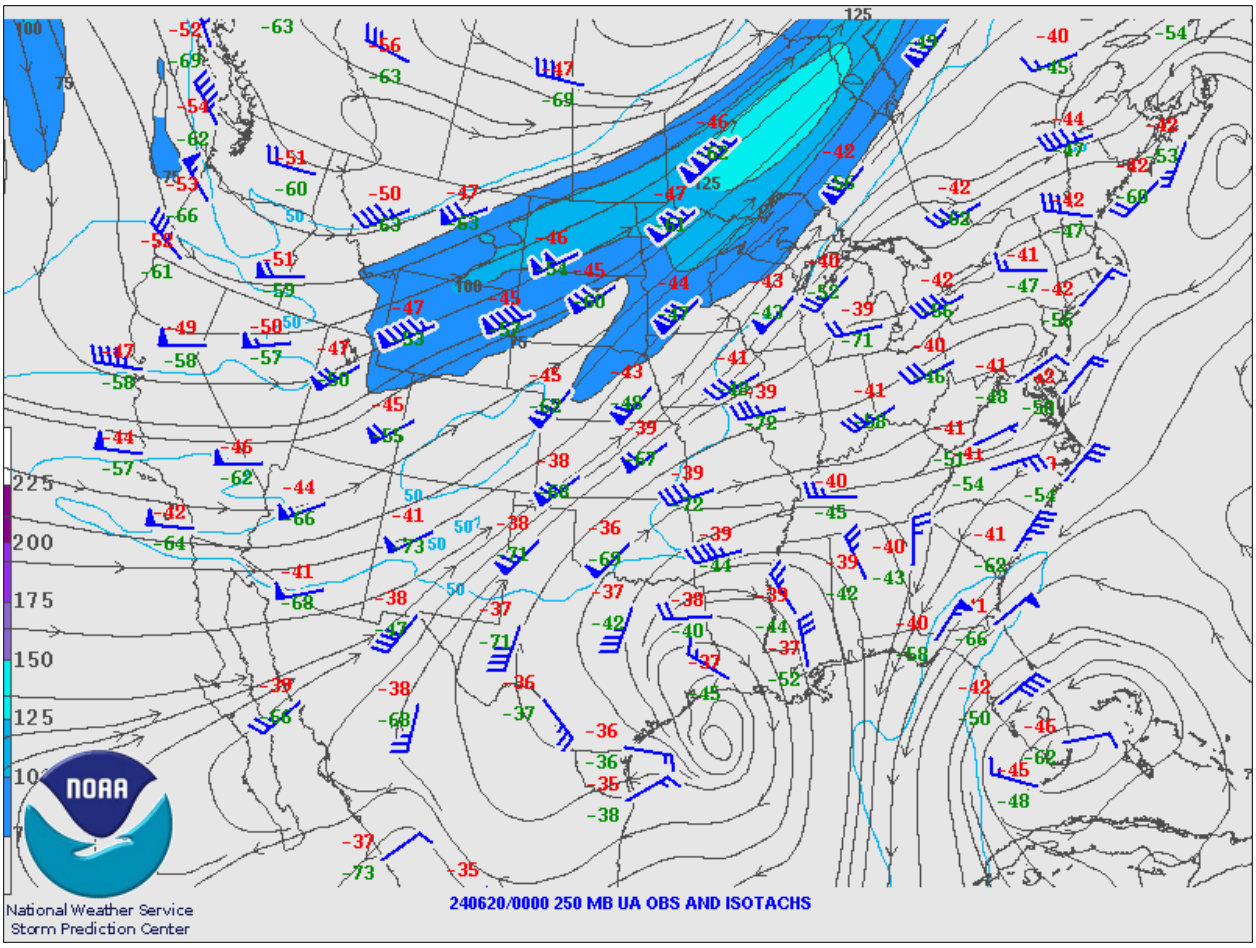

Figure 14: 250 MB Chart at 1800 MST, 6/19/2024 (0000 UTC, 6/20/2024)

Barometric pressure increased at the surface across Texas and eastern New Mexico in response to the westward movement of the upper-level high-pressure system. This westward shift of the high-pressure system to the Texas coast increased the pressure gradient over New Mexico.

Although New Mexico is well above sea-level, it is possible to estimate sea-level pressure over higher terrain. Figures 15 and 16 show the sea-level analyses for the same times as Figures 12 and 13. In Figure 15, the 1012 MB isobar is noticeably further west and into New Mexico at 1800 MST than it was 12 hours prior in Figure 15.

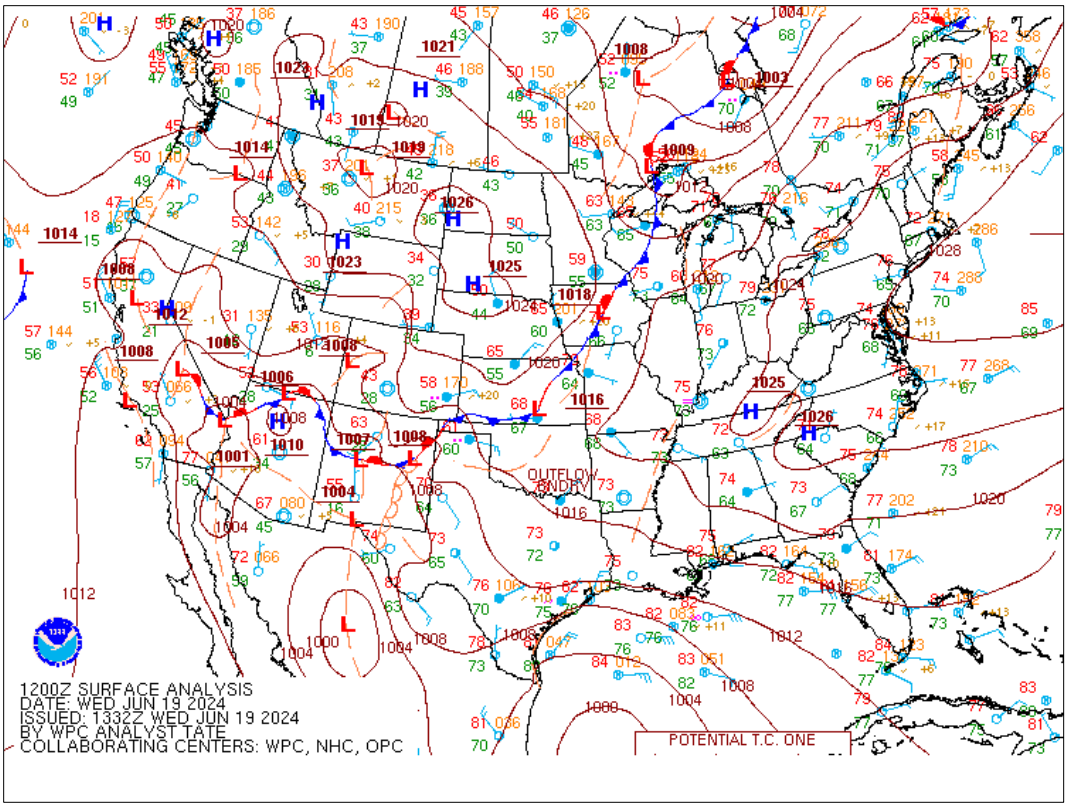

Figure 15: Sea-level Pressure Analysis at 0600 MST, 6/19/2024

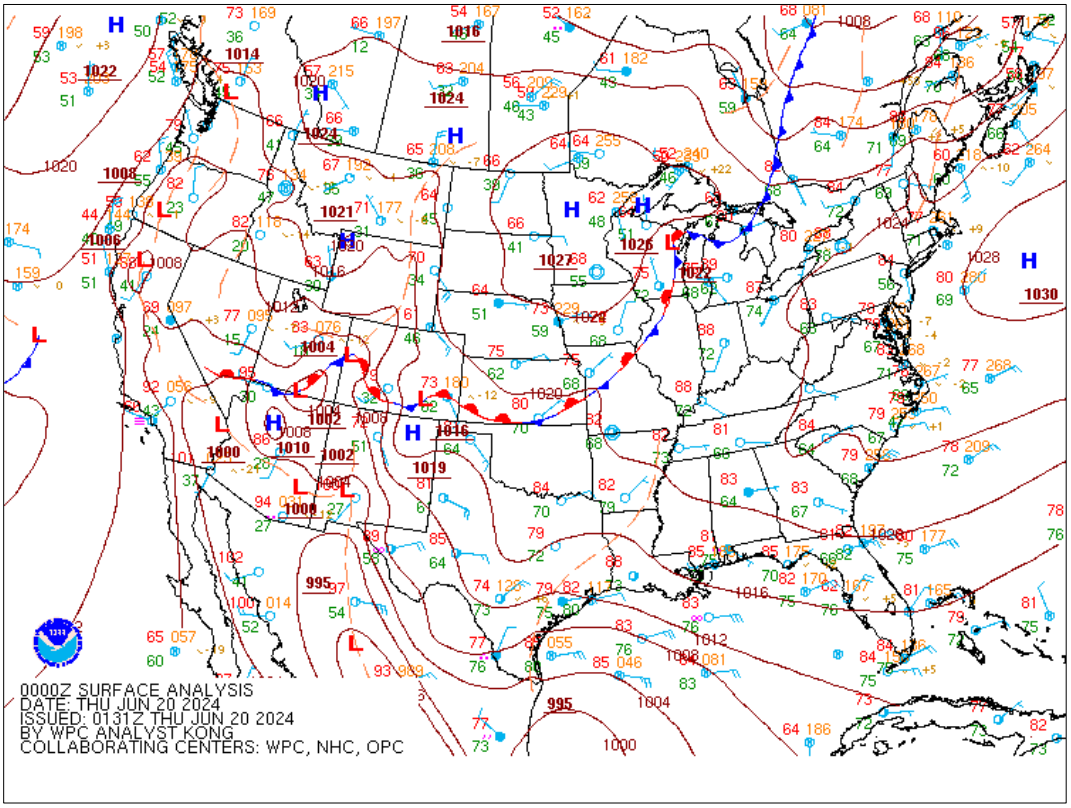

Figure 16: Sea-level Pressure Analysis at 1800 MST, 6/19/2024

The second change in the regional weather pattern was the creation a large area of rain-cooled air. Figure 17 shows a broad area of rainfall over the southern High Plains. The weather observations plotted in Figure 17 reported rainfall in southeast Colorado, southwest Kansas, the Texas Panhandle, and northeast New Mexico, on the morning of June 19, 2024. The symbol for rain is dots on the left side of the observation.

Both the rain-cooled air and the westward movement of the upper-level high-pressure system likely affected the pressure gradient over central New Mexico. In Figure 14, the 1016 MB pressure line is outside of northeast New Mexico at 0600 MST, June 19, 2024. By 1800 MST (Figure 16), the 1016 MB pressure line is well inside northeast New Mexico and there is a tight pressure gradient over central New Mexico.

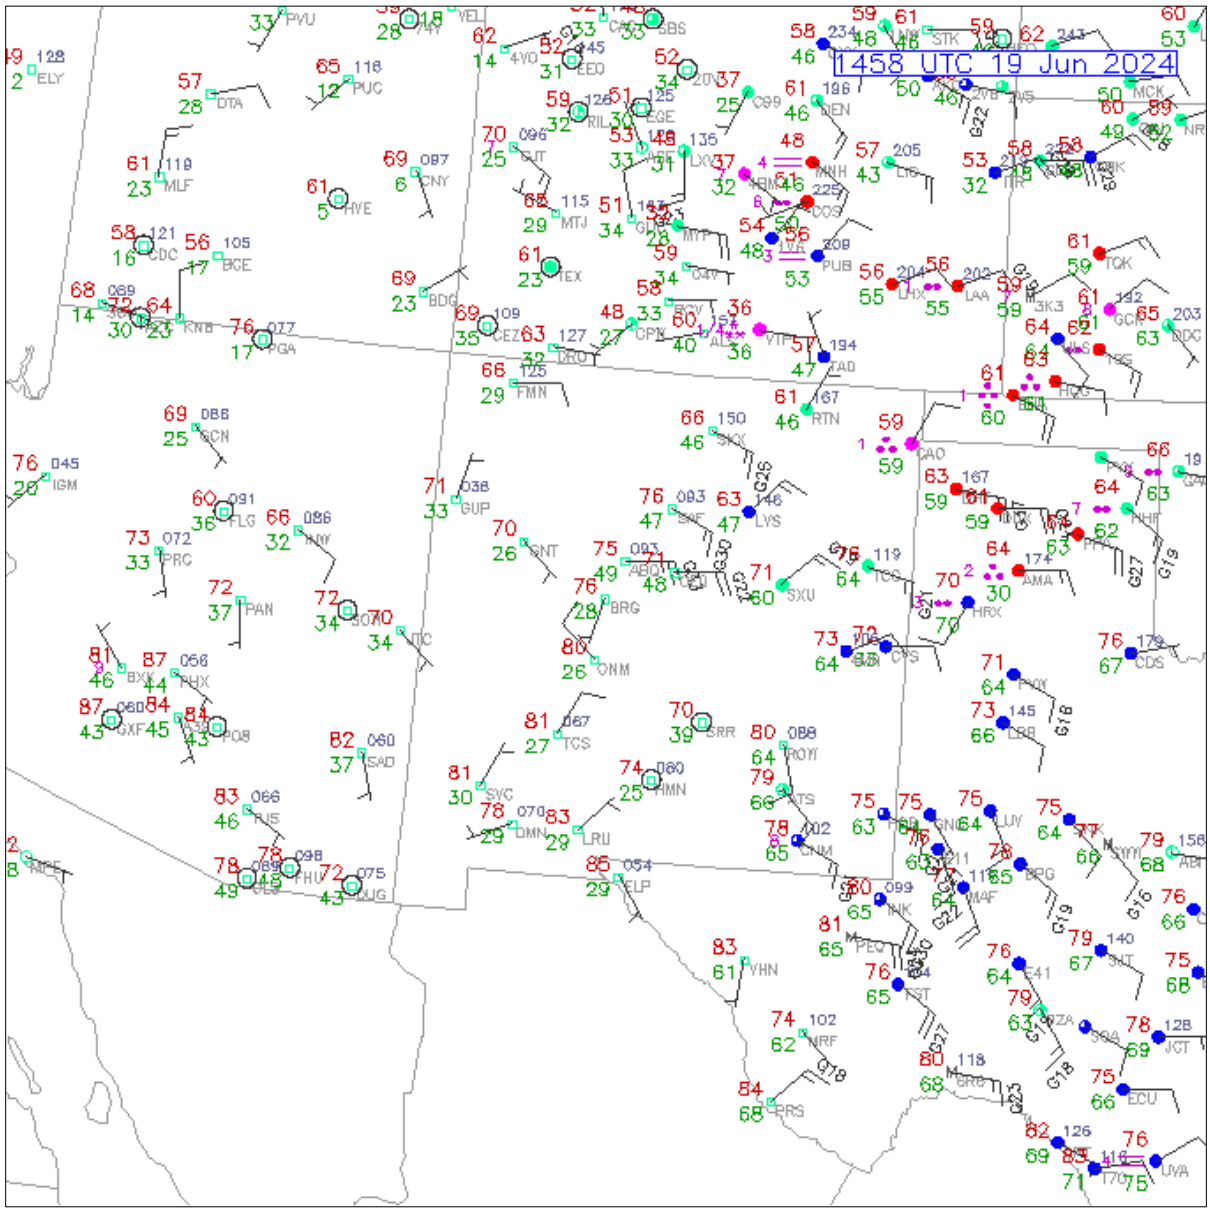

Figure 17: Weather Data Plot from New Mexico and Surrounding Areas at about 0900 MST, 6/19/2024

The tight pressure gradient that formed over central New Mexico is also evident in the 850 MB chart for 1800 MST, June 19, 2024 (see Figure 18). That's the same time as the charts Figures 13 and 15. For central New Mexico, 850 MB is usually close to the surface. The solid black lines on this chart are lines of constant height. A tight gradient of heights means there is a tight pressure gradient over the same location. Tight pressure gradients generate high winds.

The objective analysis in Figure 18 also depicts low-pressure centered along the border of Arizona and New Mexico. This is within a broader area of low-pressure both at lower and upper levels of the troposphere over the western U.S., which is evident in both Figure 18 and Figure 14.

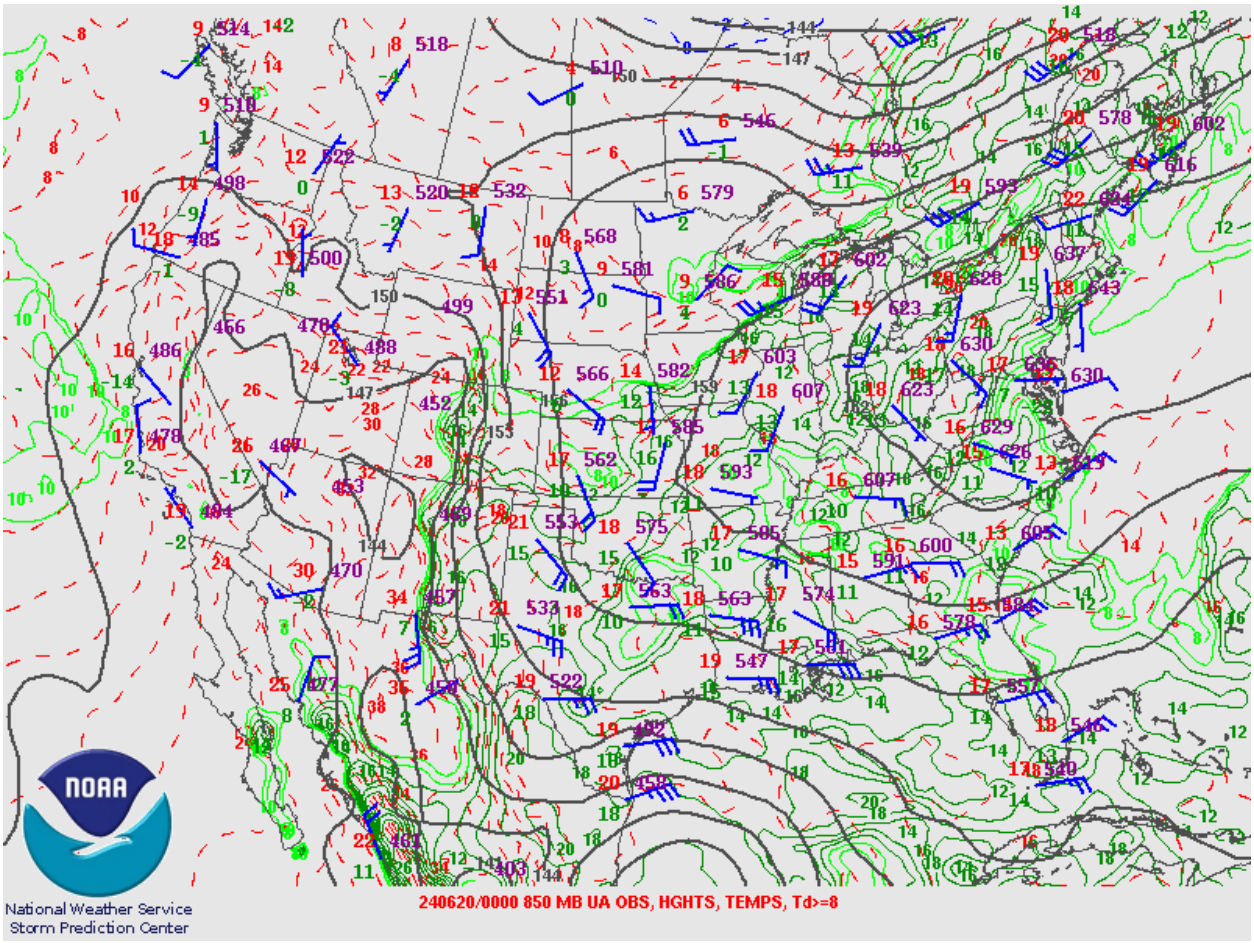

Figure 18: 850 MB Chart at 1800 MST, 6/19/2024 (0000 UTC, 6/20/2024)

Topographic Effects

The rain-cooled air from the High Plains squeezed through Tijeras Canyon in the Sandia Mountains and boosted wind speeds per the Bernoulli effect. This effect is well known among local meteorologists. Appendix D shows the first three pages of a white paper available on the local National Weather Service office at https://www.weather.gov/media/abq/LocalStudies/hww_studyBTS2010.pdf. Page 3 of this paper states "common forecaster knowledge from the local area associates these easterly high wind events with the local gap effect, or increased wind speeds associated with local topographic channeling from the Tijeras Canyon east of the City of Albuquerque."

Figure 19 shows Tijeras Canyon, the City of Albuquerque, the Sandia Mountains, the location of the KABQ ASOS, and the location of the South Valley monitor. Interstate 40 runs through Tijeras Canyon.

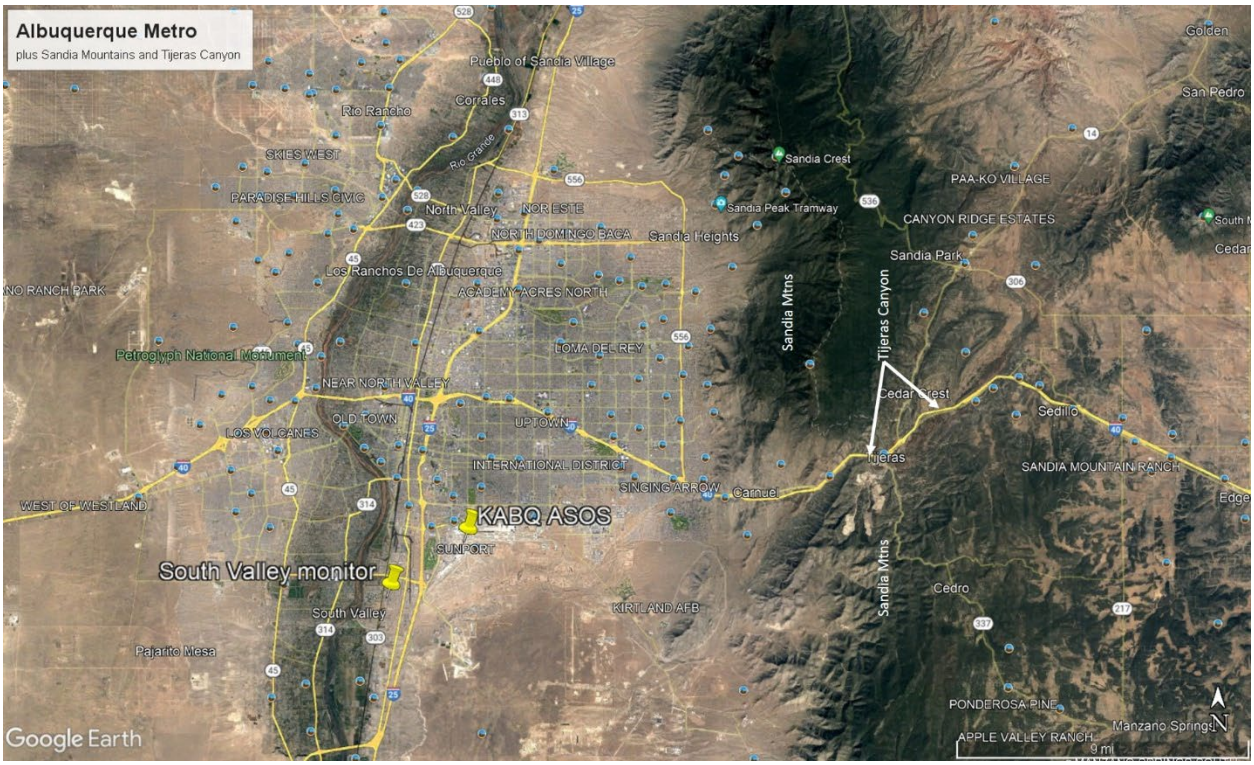

Figure 19: Aerial Photo- Tijeras Canyon, Albuquerque, KABQ ASOS, and the 2ZV Monitor

Particulate Levels

The minute data for the wind and PM_{10} in Figure 20 provides an overview of the event. The first spike in PM_{10} wasn't related to wind. Between 0400 MST and 0600 MST, PM_{10} spiked. However, wind speeds were 20 MPH or less at this time. There was another spike in PM_{10} levels between 0600 MST and 0800 MST. Sustained wind speeds exceeded the high wind threshold at that time.

The main event began around 1400 MST, i.e. mid-afternoon, with a large spike in PM_{10} levels and ended more gradually during the late evening hours. Figure 20 shows that sustained winds exceeded the high wind threshold for most of the afternoon and evening.

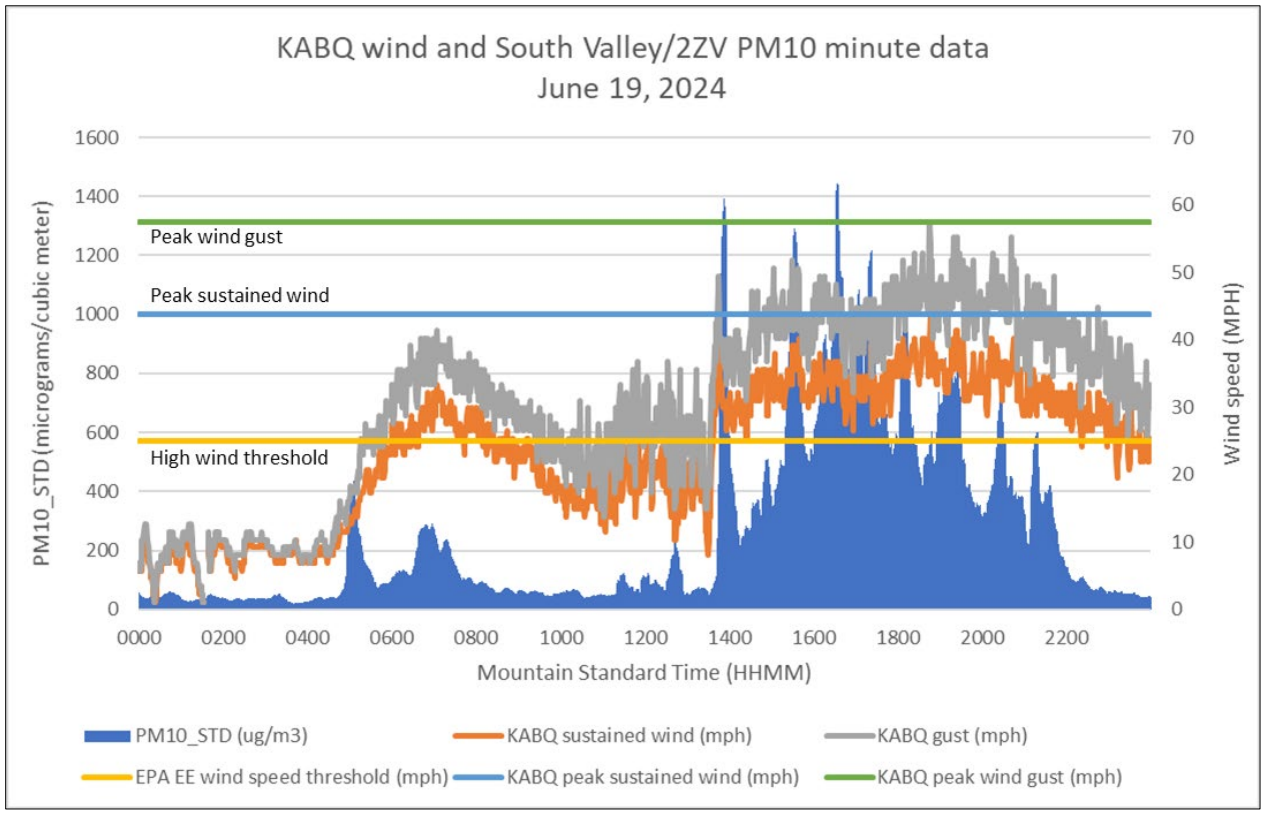

Figure 20: Event View Using KABQ Minute Wind Data and 2ZV Minute PM_{10} Data

Table 4 lines up the average particulate data with the average wind speed for each hour of the day. The particulate data in Table 4 came from AQS reports such as the one in Figure 3. The average wind speed was calculated from the KABQ minute wind data for each hour. The five hours from 1500 MST to 1959 MST had PM_{10} averages above 500 $\mu g/m^3$ and average sustained wind speeds of at least 33 MPH. The strongest winds actually occurred in the hours after the highest particulate levels. In other words, the highest particulate levels were recorded from 1600 MST to 1759 MST; the highest wind speeds were recorded between 1800 MST and 1959 MST.

Table 4: KABQ Average Wind Speeds and 2ZV Particulate Levels for Each Hour of 6/19/24

Hour (MST)	Average sustained wind speed (MPH)	Standard PM_{10} ($\mu g/m^3$)	$PM_{2.5}$ ($\mu g/m^3$)
0000 – 0059	6.7	47.7	6.7
0100 – 0159	7.5	36.7	6.1
0200 – 0259	8.3	35.5	9.2
0300 – 0359	8.1	33.5	8.8
0400 – 0459	9.0	60.2	18.3
0500 – 0559	18.7	177.3	75.8
0600 – 0659	26.6	186.8	14.1
0700 – 0759	28.6	161.3	14.1
0800 – 0859	24.8	71.5	9.3
0900 – 0959	20.5	55.9	8.0
1000 – 1059	16.6	53.7	7.6
1100 – 1159	19.0	75.5	8.4
1200 – 1259	19.5	114.2	10.8
1300 – 1359	22.7	338.4	24.6
1400 – 1459	31.3	357.3	27.4
1500 – 1559	33.8	697.0	45.9
1600 – 1659	33.6	886.2	55.5
1700 – 1759	33.1	802.1	50.0
1800 – 1859	37.0	636.9	43.2
1900 – 1959	35.2	583.4	39.3
2000 – 2059	34.8	450.4	31.8
2100 – 2159	31.6	342.9	24.2
2200 – 2259	28.9	87.3	10.4
2300 – 2359	25.2	52.6	8.3

During the hours with high winds, some weather observations taken at KABQ reported reduced visibility (less than 10 miles) and also blowing dust in the remarks section of the observations (see Table 5). The remarks about blowing dust in the 1352 MST through 2052 MST observations all indicate blowing dust within sight of KABQ. Figure 21 shows the 2ZV air quality monitor is 3 miles southwest of the KABQ weather station.

Table 5: Decoded Remarks about Dust in KABQ Weather Observations from 1352 MST to 2052 MST

MST (HHMM)	Sustained wind speed (MPH)	Visibility (miles)	Remarks regarding dust
1352	30	9	Blowing dust all quadrants
1452	36	7	Blowing dust north through east through southeast
1552	31	9	Blowing dust southeast and west
1652	33	9	Blowing dust southwest through west
1752	36	9	Blowing dust west
1852	37	7	Blowing dust all quadrants
1952	32	9	Blowing dust southeast through southwest
2052	32	9	Blowing dust south through southwest
2152	32	10	None

Figure 21: The 2ZV Monitor is about 3 Miles Southwest of the KABQ Weather Station

Camera Images

The National Weather Service (NWS) office in Albuquerque maintains three cameras at its office, which is located along the western side of the Albuquerque International Airport. One camera faces toward the west, one faces northeast, and the third faces southward.

Figure 22 looks westward across the South Valley and West Mesa of Albuquerque at 2025 MDT, or 1925 MST, on June 19, 2024. For the sake of comparison, Figure 23 shows the same view on a day with nearly perfect visibility.

Figure 22: Looking Westward Across Albuquerque's South Valley at 1925 MST, 6/19/2024

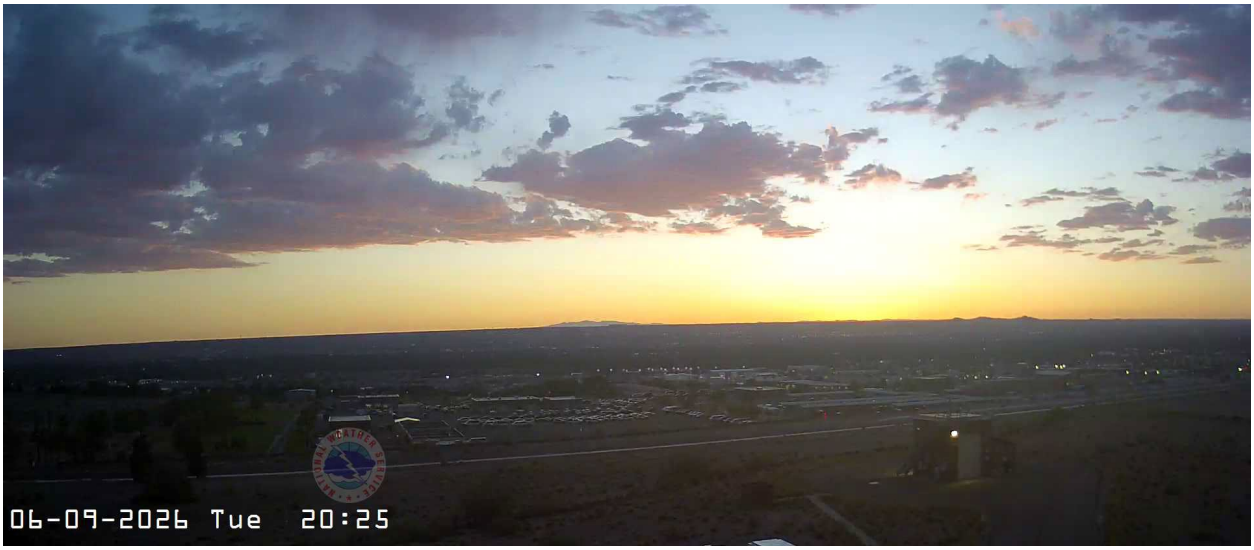

Figure 23: An Example of Great Visibility on the NWS Westward Facing Camera

Figure 24 looks westward across the South Valley and West Mesa of Albuquerque at 1615 MDT (1515 MST) on June 19, 2024. For comparison's sake, Figure 25 depicts the same view on a day with nearly perfect visibility.

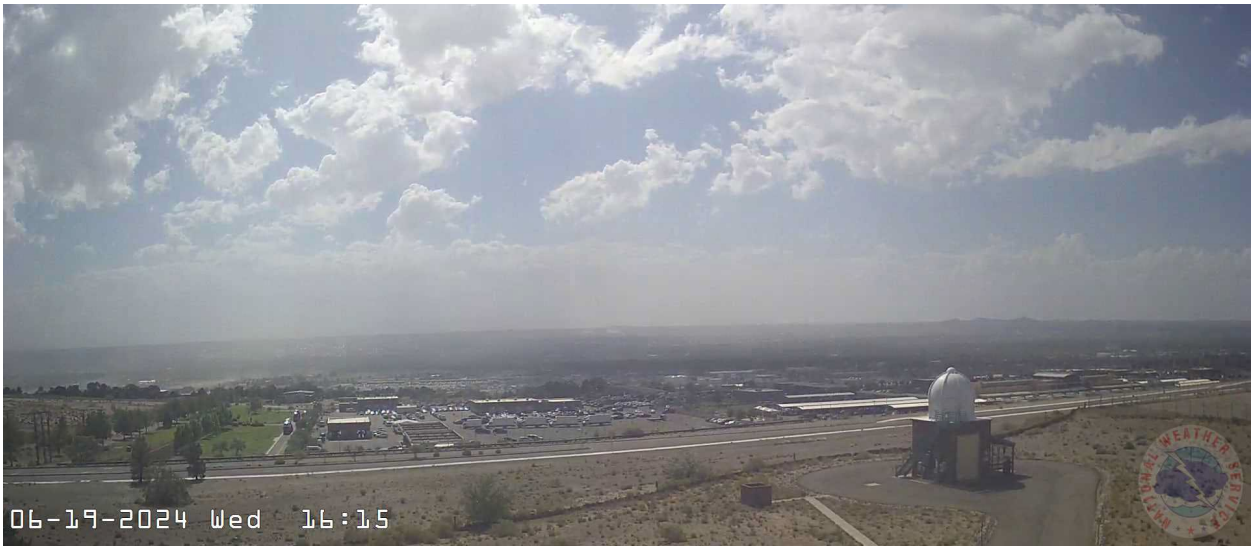

Figure 24: Looking Westward Across Albuquerque's South Valley at 1515 MST, 6/19/2024

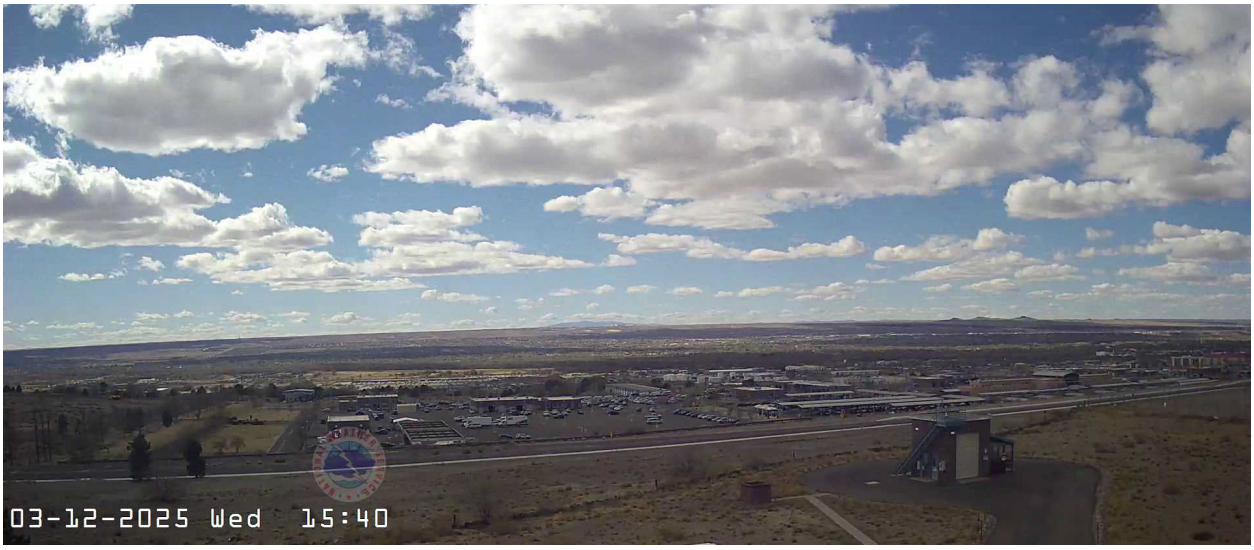

Figure 25: Another Example of Great Visibility on the NWS Westward Facing Camera

Figure 26 looks westward across the South Valley and West Mesa of Albuquerque at 1710 MDT (1610 MST) on June 19, 2024. For comparison's sake, Figure 27 depicts the same view on a day with nearly perfect visibility.

Figure 26: Looking Westward across Albuquerque's South Valley at 1610 MST, 6/19/2024

Figure 27: Another Example of Great Visibility on the NWS Westward Facing Camera

Fugitive dust from this event also affected visibility to the south. Figure 28 shows the view to the south at 1710 MDT (1610 MST) on June 19, 2024. For the sake of comparison, Figure 29 shows the same view on a day with perfect visibility.

Figure 28: NWS South-facing Camera at 1610 MST on 6/19/2024

Figure 29: An Example of Great Visibility on the NWS Southward Facing Camera

The visibility looking northeast toward the Heights of Albuquerque and the Sandia Mountains was also affected during this event. Figure 30 shows the view to the northeast at 2025 MDT (1925 MST) on June 19, 2024. For the sake of comparison, Figure 31 shows the same view on a day with normal visibility.

Figure 30: NWS Camera Facing Northeast at 1925 MST on 6/19/2024

Figure 31: An Example of Normal Visibility from the NWS Camera Facing Northeast

Event Classification

None of the Tier 1 event criteria was met with this high wind dust event. However, the wind speeds met Tier 2 criteria. Figure 19 shows many hours with sustained minute wind speeds exceeding the high wind threshold of 25 MPH.

Antecedent Conditions

The drought monitor website at https://droughtmonitor.unl.edu/ classified most of Bernalillo County, including the 2ZV monitor site and the KABQ weather station, with a moderate drought status at the time of this high wind dust event. However, the Local Climatological Data (LCD) for March, April, May, and June of 2024 at KABQ tell a different story. LCDs are published by the National Centers for Environmental Information. Appendix E includes the official monthly data from LCDs for KABQ during those four months.

Figure 1 in Appendix E shows that March 2024 brought only 0.27 inches of rain to KABQ. That's only 47 percent of normal rainfall amounts for March. Figure 2 in Appendix E shows April brought only 0.33 inches of rain to KABQ. That's 54 percent of normal rainfall amounts for April. Figure 3 in Appendix E shows that May brought only 0.06 inches of rain to KABQ- which is only 12 percent of normal rainfall amounts for May.

Figure 1 in Appendix F shows 0.20 inches of rain fell in June 2024 before the 19th. Normal rainfall for June is 0.66 inches, which works out to an average of 0.022 inches of rain each day. That means the normal rainfall for the first 18 days of June would be 0.396 inches of rain. In other words, the rainfall at KABQ for the first 18 days of June was about half of the normal amount.

Rainfall in the weeks and months prior to June 19, 2024 was well below normal and set the stage for the dust and high PM_{10} levels on June 19th, 2024. The preceding month of May 2024 was especially dry. The drought monitor's status of 'moderate' doesn't seem to take into account the unusually dry May of 2024.

Clear Causal Relationship

Comparison of the Event-Affected Day to Specific Non-Event Days

Figure 32 plots the hourly values of June 19th – not only for 2024, but for 11 of the preceding 12 years as well. June 19, 2013 was not plotted due to lack of data. None of the June 19th days from the years before 2024 show PM_{10} values or trends like that of June 19, 2024. In other words, there is no special event that occurs on June 19th of each year that causes high PM_{10} levels at the 2ZV monitor.

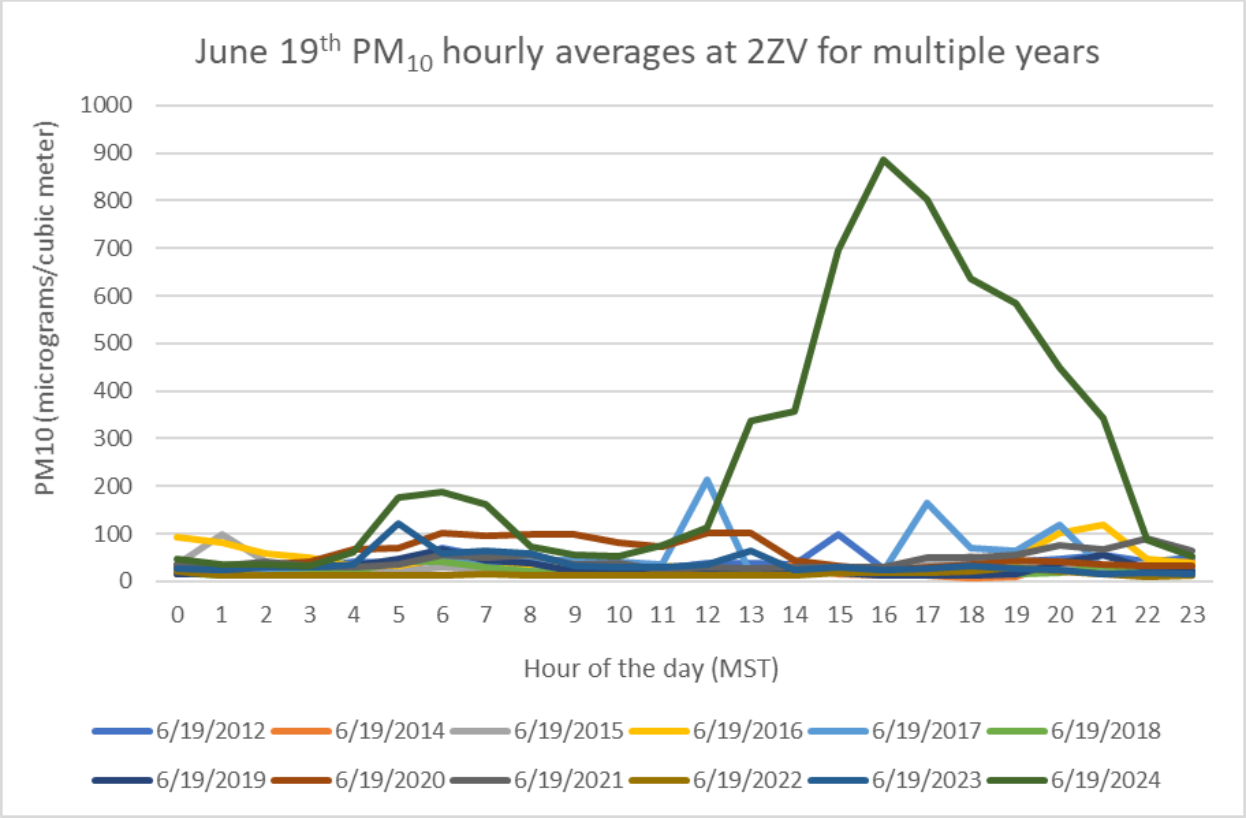

Figure 32: Comparing June 19, 2024 to June 19th of Previous Years

In Albuquerque, high wind dust events are not common in June. Figure 33 show that most Junes have no high wind dust events. However, both June 2022 and June 2024 had high wind dust events. Albuquerque received well below normal rainfall in the months before both the June 2022 and June 2024 high wind dust events.

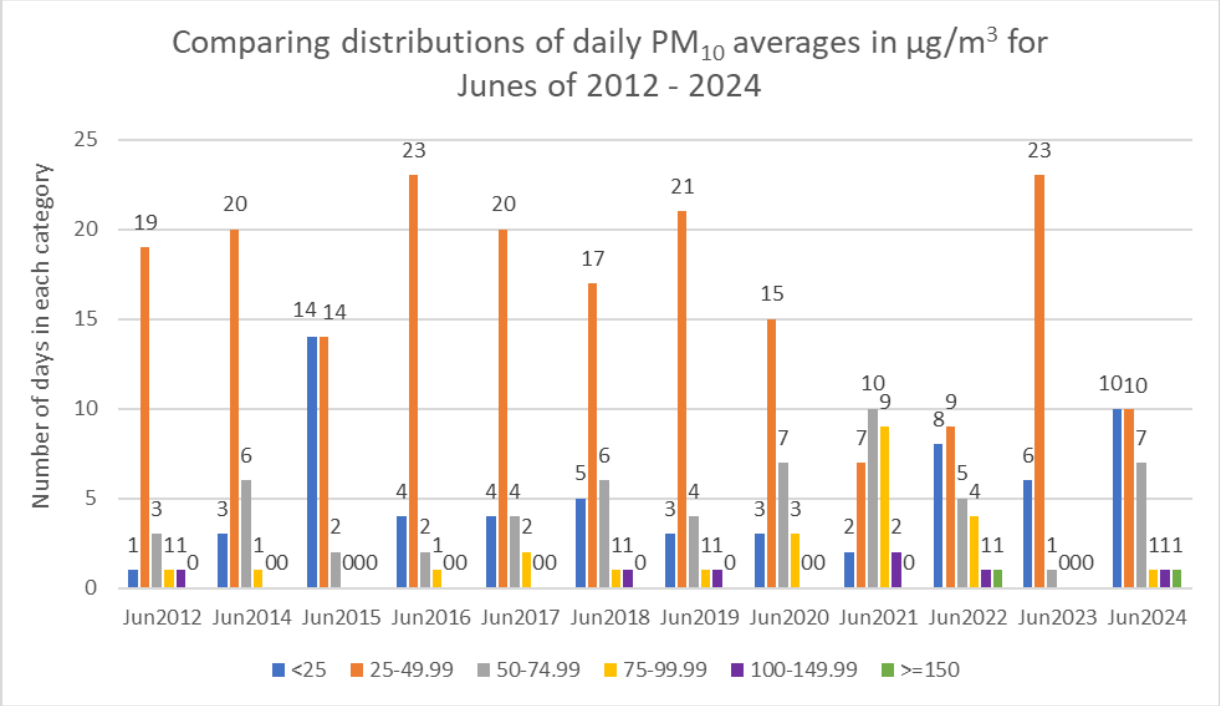

Figure 33: Comparing Distribution of 24-hour PM_{10} Averages Across Multiple Junes

Change in the Nature of High Winds from March to June

Figure 34 shows that high winds occur at KABQ nearly as many hours in June as in March. However, Figure 34 shows a significant reduction in the frequency of PM_{10} exceptional events in June compared to the Spring months of March, April, and May. Table 6 and Table 7 demonstrate a change in the nature of high wind occurrences at KABQ which explains the reduction in the frequency of exceptional events during June versus March, April, and May.

Table 6 shows that from April to June there is a decrease in the number of days with at least five consecutive hours of high winds. This is because the jet stream shifts northward during that timeframe which means that powerful cold fronts cross Albuquerque less frequently during June than during April.

Table 7 demonstrates that is an increase in the occurrence of one-hour spikes of high wind from April to June. This is due to an increase in thunderstorm activity during that timeframe. Thunderstorms often generate high winds in New Mexico due to evaporative cooling and resulting downbursts. However, thunderstorm winds usually don't last long and the resulting spike in the PM_{10} level doesn't put the 24-hour average of PM_{10} above the level of the PM_{10} standard.

On the other hand, the high winds ahead of and behind powerful Springtime cold fronts can last five hours or longer. Multiple hours of high winds and elevated PM_{10} levels are more likely to result in a 24-hour average PM_{10} in the Unhealthy for Sensitive Groups or worse AQI category. Powerful cold fronts, and thus PM_{10} exceptional events, are more common in Albuquerque during March, April, and May, but occur less frequently during June despite many hours of high wind.

Totals	**7**	**9**	**15**

*Spikes were counted when the sustained wind was over 25 MPH and the hourly sustained wind both before and after was at least 12 MPH less than the spike wind speed

Occurrence and Geographic Extent of the Event

The National Weather Service (NWS) in Albuquerque issued High Wind Warnings for the Albuquerque Metro Area three times on June 19, 2024. A High Wind Watch for this event was issued the day before. NWS forecasts for the Albuquerque Metro Area issued on June 19, 2024 predicted winds of 35 to 45 MPH with gusts to 65 MPH that night.

Although the high winds were predicted in advance of the event, there was no mention of blowing dust in any of the warnings or forecasts issued by the NWS. Furthermore, the observed wind speed exceeded the forecast wind speed during the afternoon. In other words, the high wind dust event developed earlier in the day than expected.

The NWS forecast for Albuquerque issued on the morning of June 19, 2024 predicted 20 to 30 MPH wind speeds with gusts to 40 MPH during the afternoon (Figure 36). At 1352 MST (1452 MDT), the reported wind speed was 30 MPH gusting to 49 MPH (see Table 3). At 1452 MST (1552 MDT), the KABQ wind speed was 36 MPH gusting to 45 MPH.

Despite not being mentioned in NWS forecasts, the remarks in the KABQ weather observations (Table 5) declared blowing dust visible in all directions during this event. The NWS camera images shown in Figures 21, 23, 25, 27, and 29 also demonstrate that the dust wasn't limited to a small area around the 2ZV monitor; it was a widespread high wind dust event.

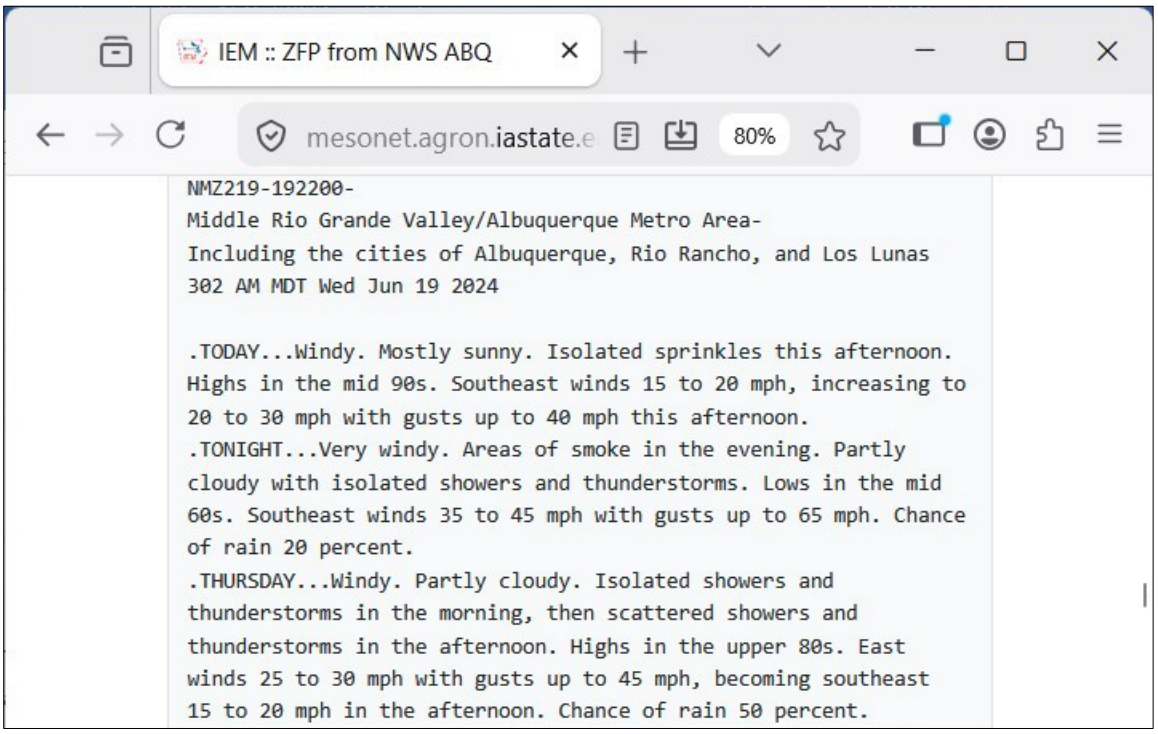

Figure 36: NWS Forecast for the Albuquerque Area Issued 302 AM MDT, 6/19/2024

Temporal Relationship Between Wind Speed and Particulate Levels

As the wind speed increases and passes the high wind threshold, increasing amounts of airborne dust result in higher PM_{10} levels and a higher $PM_{10}/PM_{2.5}$ ratio. The chart in Figure 36 is labelled with midpoints for each hour. In other words, 0930 refers to the 0900 to 1000 MST hour.

From 1200 to 1600 MST (covered by the 1230, 1330, 1430, and 1530 hourly midpoints in Figure 37), the average hourly sustained wind speed increased from 19.5 MPH during the 1200 to 1300 MST hour to 33.8 MPH during the 1500 to 1600 MST hour. During that same time, the hourly PM_{10} averages increased from 114.2 to 697 µg/m^3 and the ratio of $PM_{10}/PM_{2.5}$ increased from 8.3 to 12.1.

Every hour with an average sustained wind speed over 30 MPH also had a $PM_{10}/PM_{2.5}$ ratio over 10. A $PM_{10}/PM_{2.5}$ ratio of 10 or higher is characteristic of airborne dust and consistent with the ratio measured in past high wind dust events in Albuquerque and Bernalillo County.

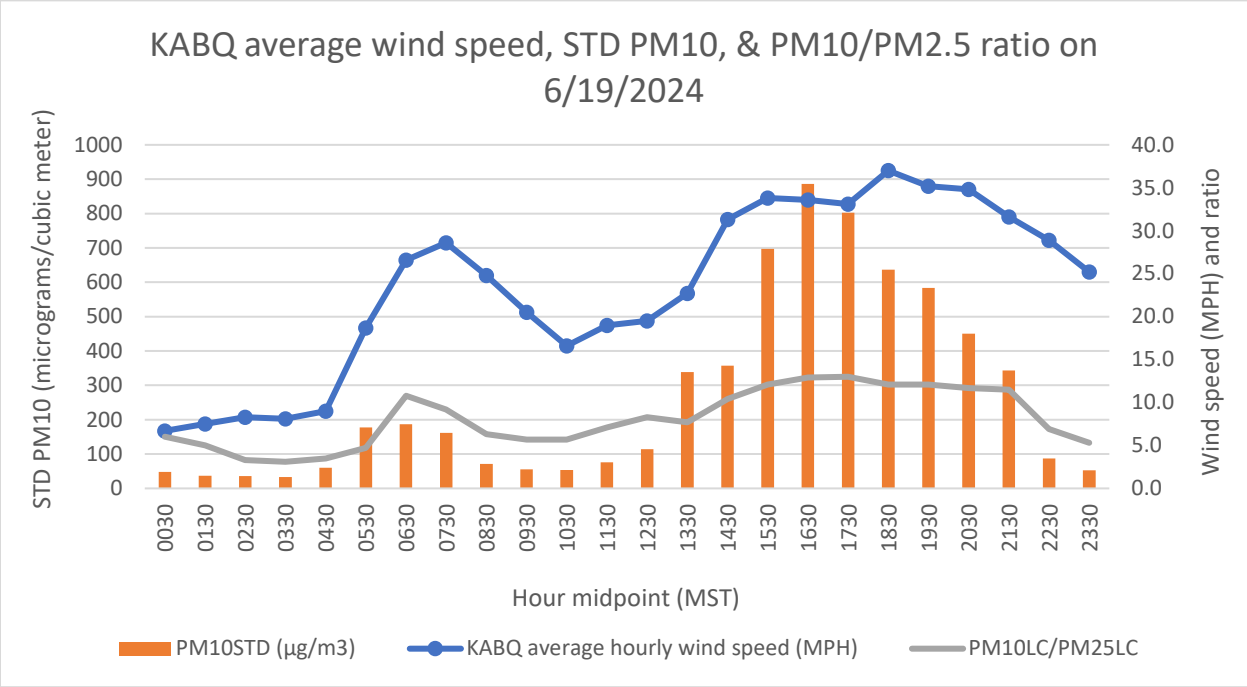

Figure 37: Relationship Between Wind Speed and PM_{10} Levels Using Hourly Data

As the wind speed increased during the afternoon, PM_{10} levels generally increased (Figure 37). However, minute data can be helpful in seeing the direct, causal relationship between wind speed and PM_{10} during a high wind dust event. Figure 37 zooms into the 1300 to 1430 MST time frame with minute data. Specifically, the 20 minutes from 1330 MST to 1350 MST show a tremendous increase in wind speed and the resulting increase in PM_{10} levels.

A rapid increase in wind speed occurred at KABQ between 1330 MST and 1350 MST with the passage of the cold front (Figure 38). It wasn't just the increase in wind speed that marked the passage of the cold front. Between the 1252 MST observation and the 1352 MST observation, the temperature dropped 5°F. The station pressure which had been falling in the preceding hours was steady beginning with the 1352 MST observation.

Wind speed increased at the 2ZV air quality monitor also, but not as much as it did at KABQ. As the land use map in Figure 5 and the aerial photograph of the neighborhood in Figure 39 show, the surface roughness at the 2ZV monitor is much higher than at KABQ, which is at an airport. The PM_{10} level at 2ZV started increasing a few minutes after the sustained wind speed reached the high wind threshold of 25 MPH at KABQ. The ratio of PM_{10} to $PM_{2.5}$ also increased from about 5 at 1330 MST to about 13 at 1345 MST. $PM_{10}/PM_{2.5}$ ratios above 10 are characteristic of locally generated blowing dust.

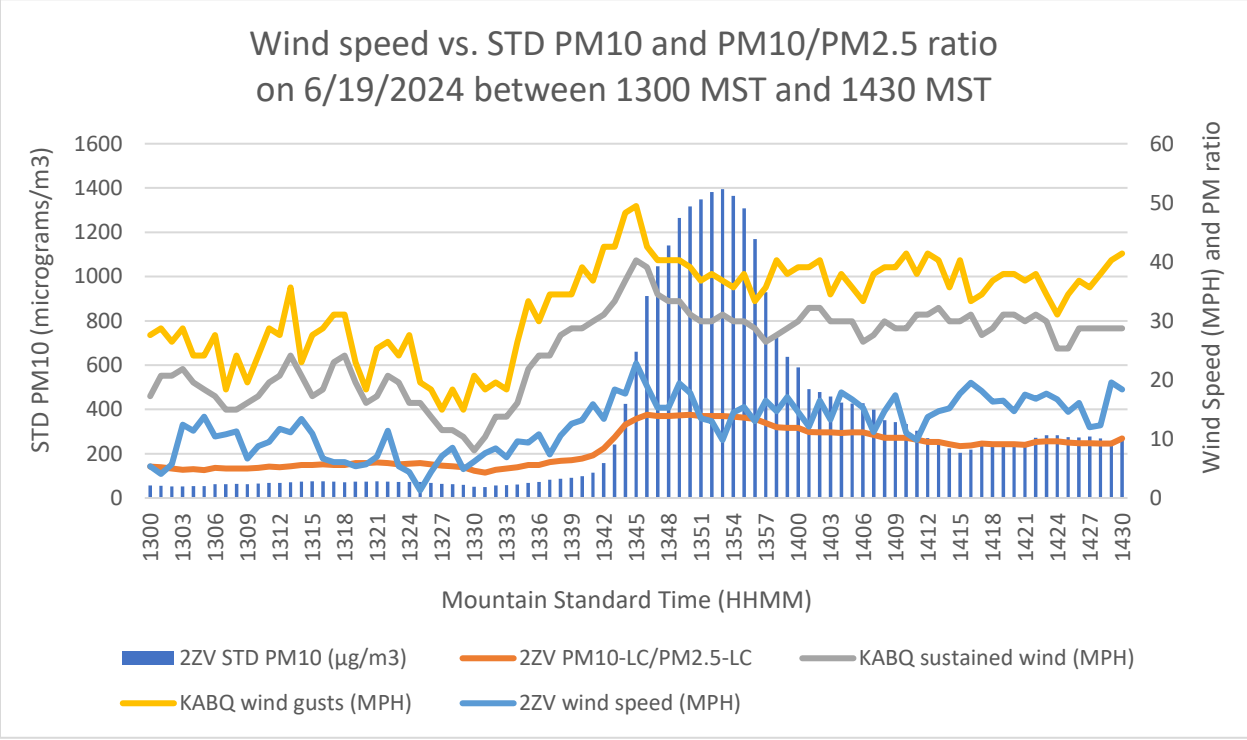

Figure 38: Minute Data for Wind Speed and Particulates, 6/19/2024 from 1300 to 1430 MST

Transport of Event Emissions to the 2ZV Monitor

As shown in Figure 21, the 2ZV air quality monitor is about 3 miles southwest of the KABQ ASOS weather station. Table 8 includes the average wind direction at both sites for the hours with average wind speeds over 30 MPH at KABQ.

The average hourly wind directions at 2ZV were almost exactly the same as those at KABQ. The hours of 1600 to 1659 MST and 1700 to 1759 MST were the hours with the highest particulate levels. The hours of 1800 to 1859 MST and 1900 to 1959 MST were the hours with the highest average wind speeds at KABQ.

The average wind direction is plotted upwind of the 2ZV monitor on Figure 39 and Figure 40. The direction of the arrows was based on the average wind directions calculated in Table 8. Figure 40 is zoomed-in to the area immediately upwind of the 2ZV monitor which is on the left side of the image; Figure 41 is zoomed-out to cover a larger area and the South Valley monitor is still located in the left side of the image.

Both aerial images (Figure 39 and Figure 40) show the sparse vegetation upwind of the monitor. Specifically, both images include a grass field next to the monitor which is a stark contrast to the sparse vegetation in the rest of the image.

Table 8: Average Wind Directions from 1400 MST to 2159 MST on 6/19/2024

Hour (MST)	KABQ average wind direction (° from north)	KABQ average wind speed (MPH)	2ZV average wind direction (° from north)	2ZV average wind speed (MPH)
1400 - 1459	109	31.3	110	16.7
1500 – 1559	107	33.8	108	19.3

Figure 40: Zoomed-out Image of the Area Upwind of the 2ZV Monitor; Arrow Shows Wind Direction

Assessment of Transport as a Possible Alternative Cause for the 6/19/2024 Event

Airborne dust is either generated locally within Bernalillo County or transported into Bernalillo County by the wind. In addition to the high ratio of PM_{10} to $PM_{2.5}$ during this event, weather observations taken upwind from Albuquerque on June 19, 2024 can be used to rule out the possibility of transport.

Figure 15 (surface maps in narrative section) shows the pressure gradient that formed over central New Mexico and caused the high wind dust event in Albuquerque that day. If dust had been generated by high winds upwind of Albuquerque, the weather stations at Clines Corners (KCQC), Las Vegas (KLVS), or Tucumcari (KTCC) would have reported high winds or dust or haze or visibility reduction. Figure 41 shows the location of each of these weather stations relative to Albuquerque.

Weather observation data for the upwind stations is included in Appendix F. Clines Corners (KCQC) is the closest upwind weather station from Albuquerque for this event. None of the remarks in the raw METAR-coded weather observations reported dust at KCQC on June 19, 2024. The decoded data from KCQC shows none of the observations from June 19, 2024 reported reduced visibility or weather codes for dust or haze.

Only one weather observation from KCQC reported sustained winds at or above the high wind threshold of 25 MPH. At 1453 MST, a sustained wind of 26 MPH was reported at KCQC. The volume of dust and the PM_{10} level reported in the Albuquerque area are unlikely to have been generated by a single hour of wind speed barely above the high wind threshold at KCQC. In fact, Table 2, Table 3, and Table 4 show high winds, blowing dust, and elevated PM_{10} levels were reported in Albuquerque before 1453 MST.

Some of the observations taken at KLVS on June 19, 2024 reported winds out of the northeast and some reported winds out of the east. KLVS should be considered an upwind weather station particularly during the hours when winds were out of the northeast. None of the observations from KLVS that day reported dust or haze in either the weather codes or the remarks (see Appendix F, Item 3.a). There were many observations at KLVS with reduced visibility (see Appendix F, Item 3.b). However, the reduced visibility was accompanied by weather codes for thunderstorms, rain, and/or mist (light fog).

Only two KLVS observations reported high winds. Both the hourly observation at 1353 MST and the special observation at 1409 MST reported 25 MPH winds. Both the 1353 MST and 1409 MST observations had wind directions out of the east. Wind directions remained out of the east for a few hours after the high winds at KLVS. The dust at KABQ did not come from the weather at KLVS. In fact, the high winds, blowing dust, and elevated PM_{10} levels were already beginning in Albuquerque at the same time the high winds occurred at KLVS.

Weather observations taken at KTCC reported no visibility restrictions, dust, or haze (see Appendix F, Items 4.a and 4.b). Only one KTCC observation reported a high wind. The wind speed in the special observation taken at 1218 MST was 25 MPH. It is unlikely that a brief occurrence of high wind in Tucumcari contributed a significant amount of dust to high wind dust event that soon commenced in Albuquerque.

Figure 41: Locations of Upwind Weather Stations Relative to Albuquerque

Reasonable Controls Analysis

Fugitive Dust Control Regulation

Albuquerque-Bernalillo County is currently in attainment for the PM_{10} NAAQS and no SIP for PM_{10} currently exists. In 2008, the Albuquerque-Bernalillo County Air Quality Control Board (AQCB) adopted the Part 20 Fugitive Dust Control regulation (see Appendix B). The objective is to ensure that every person uses reasonably available control measures, or other effective measures, on an ongoing basis to prevent or abate fugitive dust.

The regulation defines "reasonably available control measure" or "control measure" as:

> "…a device, system, process modification, apparatus, technique, work practice, or combination thereof, that mitigates fugitive dust and includes the measures in 20.11.20.23 NMAC and any other regulatory control program that results in equivalent protection of a disturbed surface or inactive disturbed surface area, whether or not the purpose of the control measure is to mitigate dust or to meet another requirement of 20.11.20 NMAC or any other statute or regulation."

The continued attainment status for PM_{10} shows that the use of reasonably available control measures under 20.11.20 NMAC has been helpful.

With many of the recent dust events being due to lack of precipitation and non-anthropogenic factors, the continued implementation of 20.11.20 NMAC, which requires permits for human-caused land disturbances of more than three quarters of an acre and the use of reasonably available control measures, is a key part of the AQP's strategy to mitigate the effects of drought and dust events throughout Bernalillo County. The AQP has jurisdiction over Bernalillo County, except for Native American Tribal lands.

Permits

According to records, there were a total of 2038 active Fugitive Dust Control (FDC) Construction/ Programmatic permits and Stationary Source permits in Bernalillo County on June 19, 2024 (see Appendix G). FDC Construction Permits are issued for construction work, or any disturbances that will result in a man-made structure or facility, pursuant to requirements in 20.11.20.14 NMAC. FDC Programmatic Permits, pursuant to requirements in 20.11.20.13 NMAC, are issued for properties that do not have enough vegetation to hold down soil, or if they have active routine operations that will not result in construction of a man-made structure or facility (i.e. dirt parking lots, salvage yards, etc.).

Stationary Source Permits, issued to industrial or other process-type facilities, include FDC permit conditions. Permittees are required to utilize reasonably available control measures throughout the duration of the permit.

Figure 42, an aerial image of the area in the immediate vicinity of the 2ZV Monitor, shows locations of the FDC Construction/Programmatic permits and stationary source permits. Figure 42 contains a larger area and shows FDC Construction/Programmatic permits and stationary source permits in the zip code where the 2ZV monitor is located.

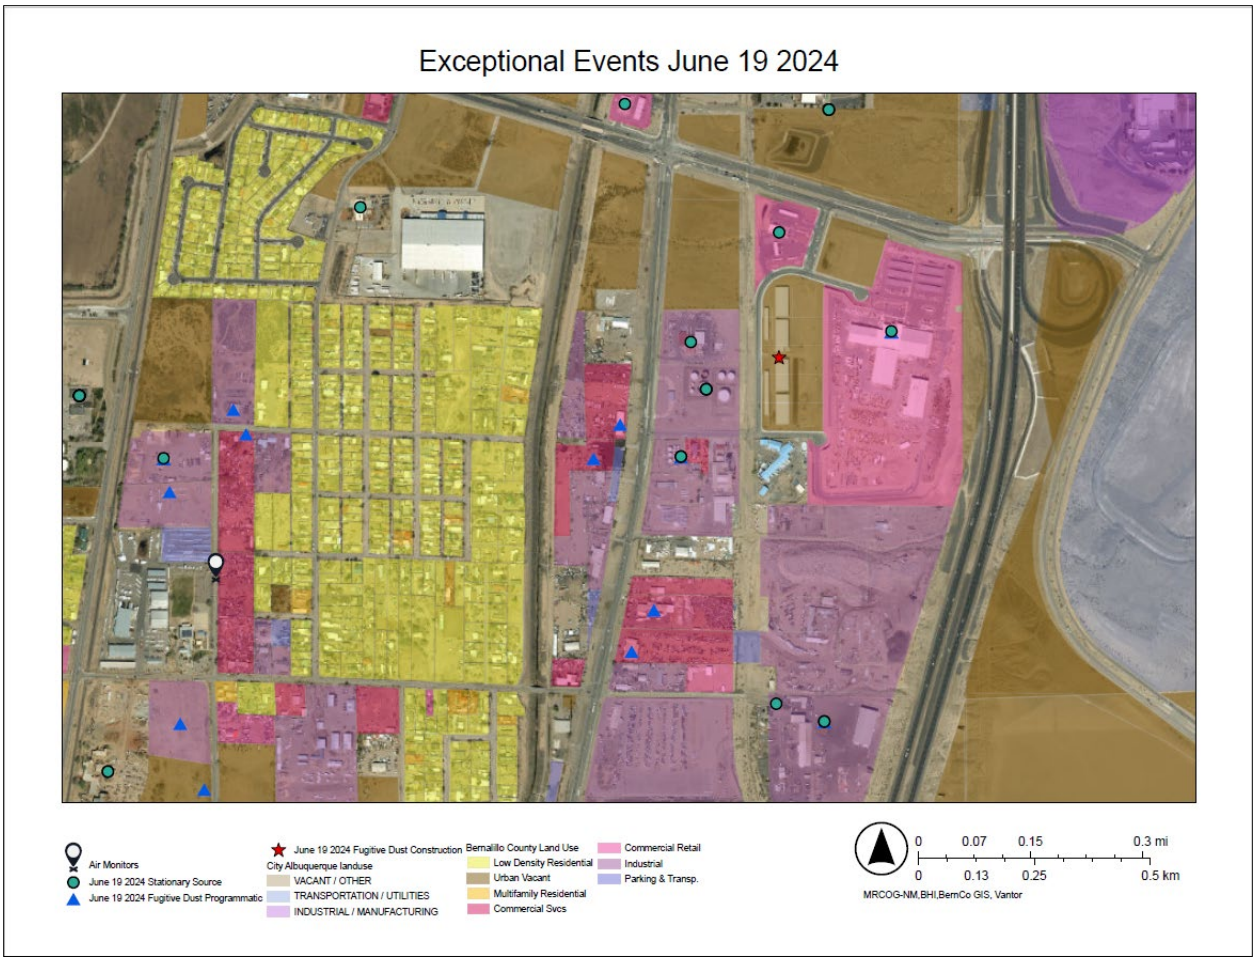

Figure 42: Locations of Various Air Quality Permits in the Immediate Vicinity of the 2ZV Monitor

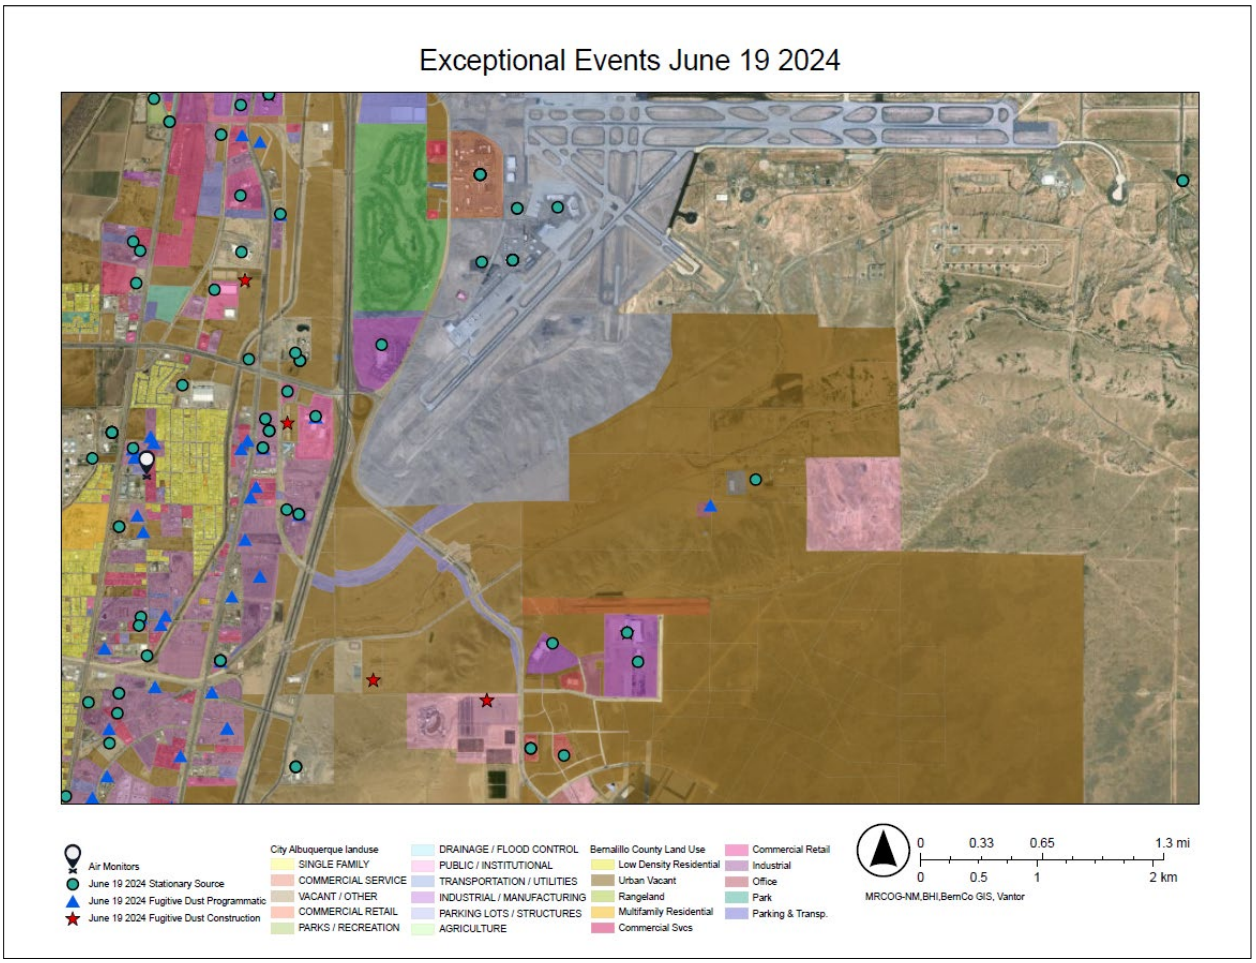

Figure 43: Locations of Various Air Quality Permits within the Zip Code of the 2ZV Monitor

For this event, the AQP has record of 240 active Fugitive Dust Control (FDC) Construction permits (covering construction sites) across Bernalillo County on June 19, 2024. Approximately 4 of those permits were located in the same zip code as the 2ZV monitor, with an estimated 1% construction dust permits located in the immediate vicinity of the monitor. There were 168 active FDC Programmatic dust permits (permits covering parking lots, salvage yards, empty lots, etc.) across Bernalillo County on June 19, 2024. Approximately 28 of those permits were located in the same zip code as the 2ZV monitor, and an estimated 5% of the programmatic permits were located in the immediate vicinity of the monitor.

There were 1633 stationary source permits (which include FDC emission conditions) across Bernalillo County on June 19, 2024. Approximately 50 of those permits were located in the same zip code as the 2ZV monitor, and an estimated 0.7% of the stationary source permits are located in the immediate vicinity of the monitor. Approximately 1.2% of all sources of permits in Bernalillo County were in the immediate vicinity of the 2ZV monitor and located upwind of the 2ZV monitor during the event period.

Pursuant to the FDC regulation, stop work orders can be issued to local contractors and businesses that generate dust during high wind dust events, which are generally when sustained winds reach 25 mph or more. On June 19, 2024, a high wind event stop work order was not called due to the event occurring at

night after normal business hours. However, notification was sent to contractors to water their site to control dust before leaving at the end of the work day on June 18, 2024.

These controls are reasonable and effective since Albuquerque-Bernalillo County does not experience frequent exceedances of the NAAQS. With the exception of Tribal lands and counties outside of Bernalillo County, the FDC rule was in place to regulate those businesses or activities that may have contributed to the event.

Based on documentation provided in this demonstration, the event qualifies as a natural event. The June 19, 2024 data associated with the event meets the regulatory definition of a natural event that was not reasonably controllable or preventable [see 40 CFR § 50.14(b)(8)]. This event transported windblown dust from anthropogenic sources within Bernalillo County, excluding Tribal lands, which were reasonably controlled at the time of the event. Accordingly, the AQP has demonstrated that the event is a natural event that should be considered for treatment as an exceptional event.

Public Notification

The EPA's Exceptional Events Rule [40 CFR 50.14(c)(1)(i)] requires that state, local, and tribal air agencies provide prompt public notification whenever air quality concentrations exceed or are expected to exceed a National Ambient Air Quality Standard (NAAQS).

National Weather Service (NWS) Warnings/Watches/Advisories

The Albuquerque National Weather Service (NWS) office predictions of high wind dust events and are likely to be the first report to reach media for these types of events. Often, radio stations will feature these reports a part of the local news, particularly when wind speed elevates quickly. The Air Quality Program (AQP) may issue alerts based on these warnings from the NWS.

National Weather Service High Wind Warning- morning

The Albuquerque, NM NWS issued a high wind warning before this event.

NWS High Wind Warning for the Middle Rio Grande Valley including the Albuquerque Metro Area (Wednesday, June 19, 2024, 3:48AM MDT): The National Weather Service, Albuquerque, NM issued a "…high wind warning remains in effect from 6 PM this evening to 6 AM MST Thursday…

Southeast and east winds 25 to 40 mph with gusts up to 60 mph expected…

Damaging winds could blow down trees and power lines… travel will be difficult, especially for high profile vehicles…

Expect the strongest wind gusts below Tijeras Canyon in Albuquerque…"

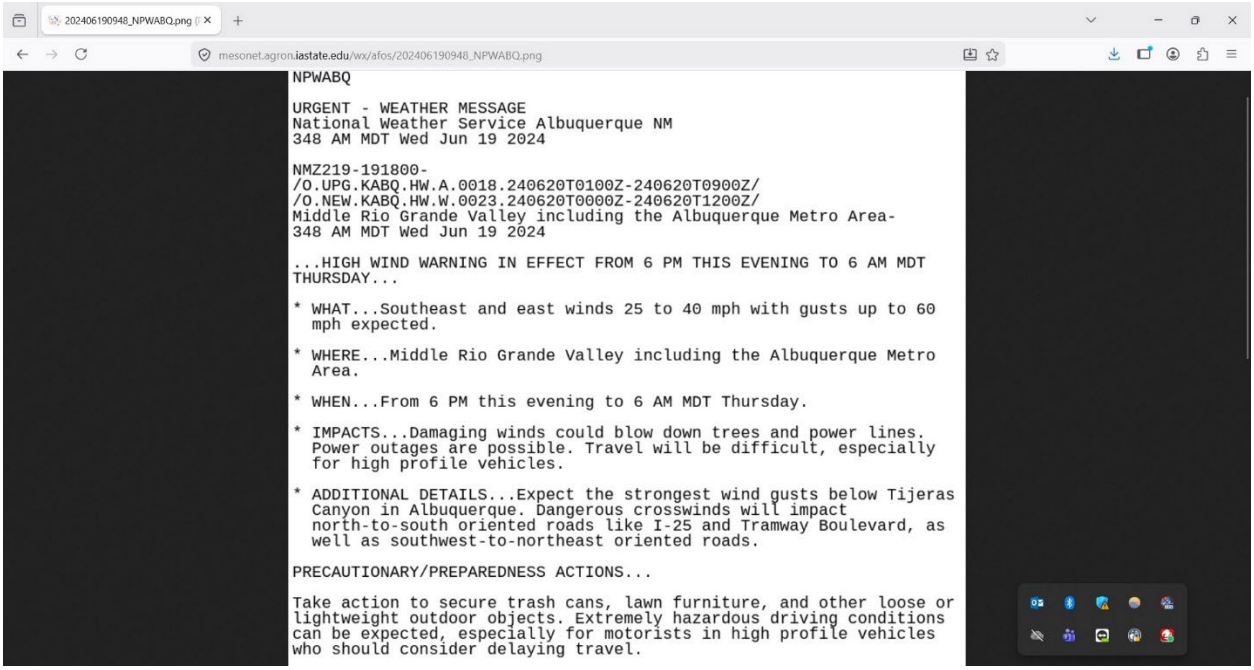

Figure 44: High Wind Warning Issued by NWS- Albuquerque, NM, 06/19/2024, 3:48 AM MDT

<u>National Weather Service High Wind Warning- noon</u>

The Albuquerque, NM NWS updated its high wind warning before this event.

National Weather Service High Wind Warning for the Middle Rio Grande Valley including the Albuquerque Metro Area (Wednesday, June 19, 2024, 12:07PM MDT): The National Weather Service, Albuquerque, NM issued a "…high wind warning remains in effect from 6 PM this evening to 6 AM MST Thursday…

Southeast and east winds 25 to 40 mph with gusts up to 60 mph expected…

Damaging winds could blow down trees and power lines… travel will be difficult, especially for high profile vehicles…

Expect the strongest wind gusts below Tijeras Canyon in Albuquerque…"

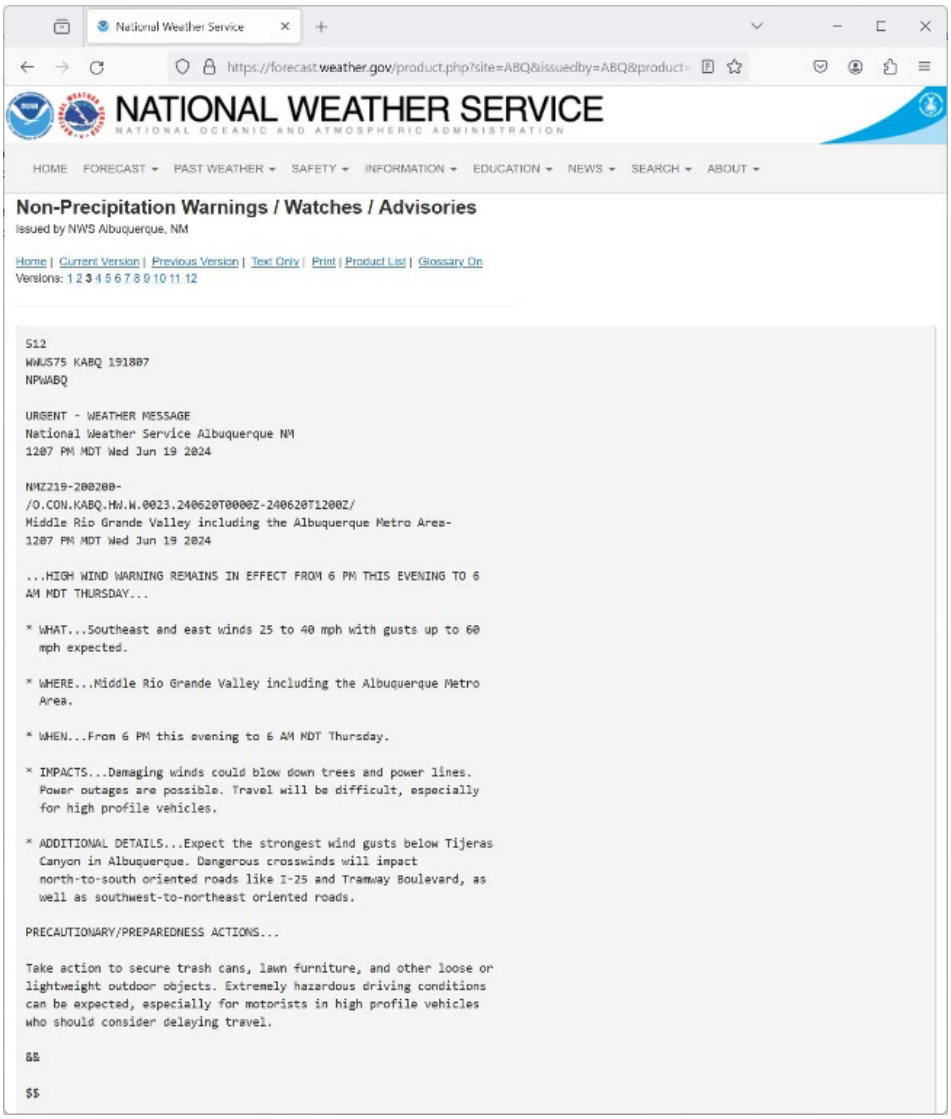

Figure 45: High Wind Warning Issued by NWS- Albuquerque, NM, 06/19/2024, 12:07 PM MDT

Albuquerque-Bernalillo County Air Quality Program Notifications

The Albuquerque-Bernalillo County Air Quality Program (AQP) developed the following methods to provide notification of these events to the public:

Monitoring Website: The Albuquerque-Bernalillo County Air Quality Program Ambient Air Monitoring Network webpage contains current air quality conditions. The webpage is accessible to the public and it features five EPA-certified Ambient Air Monitoring Stations located across Albuquerque-Bernalillo County with near "real-time" air quality data. Each monitor shows the current local air quality conditions.

Albuquerque-Bernalillo County Air Quality Program Dust Related Warnings, Shut Downs and Health Alerts: The AQP developed procedures to notify permit holders and the public of events expected or

happening which affect air quality and public health. The AQP relies on NWS forecasts warning systems to alert the public. The AQP may issue a health alert to amplify the message.

Standard Operating Procedure for: 1) notifying permit holders of high wind forecast and possibility of fugitive dust; 2) notifying permit holders and the public when a Shut Down Notice has been issued, and 3) notifying the public when a health alert has been issued.

The AQP uses the following "opt-in" platforms: RAVE© (an emergency alert system) Mailchimp©, X©, Facebook©, and internal Outlook© listservs for public notifications.

The procedure is reviewed and updated periodically.

For the June 19, 2024 Exceptional Event, the AQP provided the following public notifications:

- Wind and Dust Forecast
- Health Alert Due to Blowing Dust

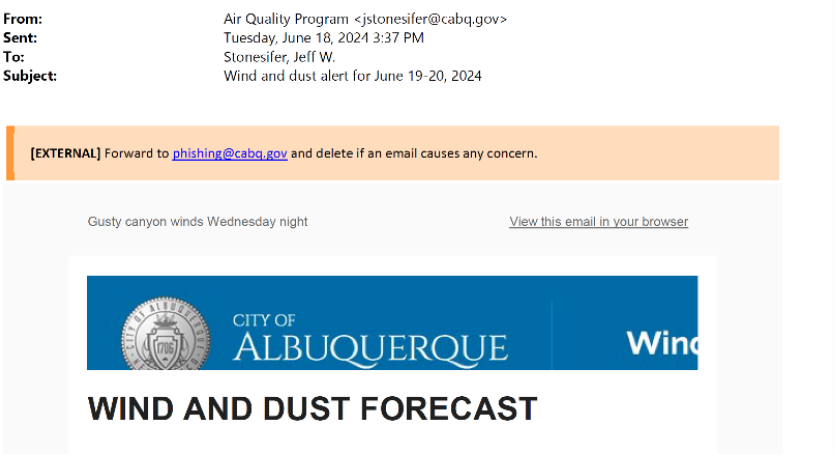

Figure 46: Wind and Dust Forecast Issued via E-mail, 6/18/ 2024, 3:37 PM MDT

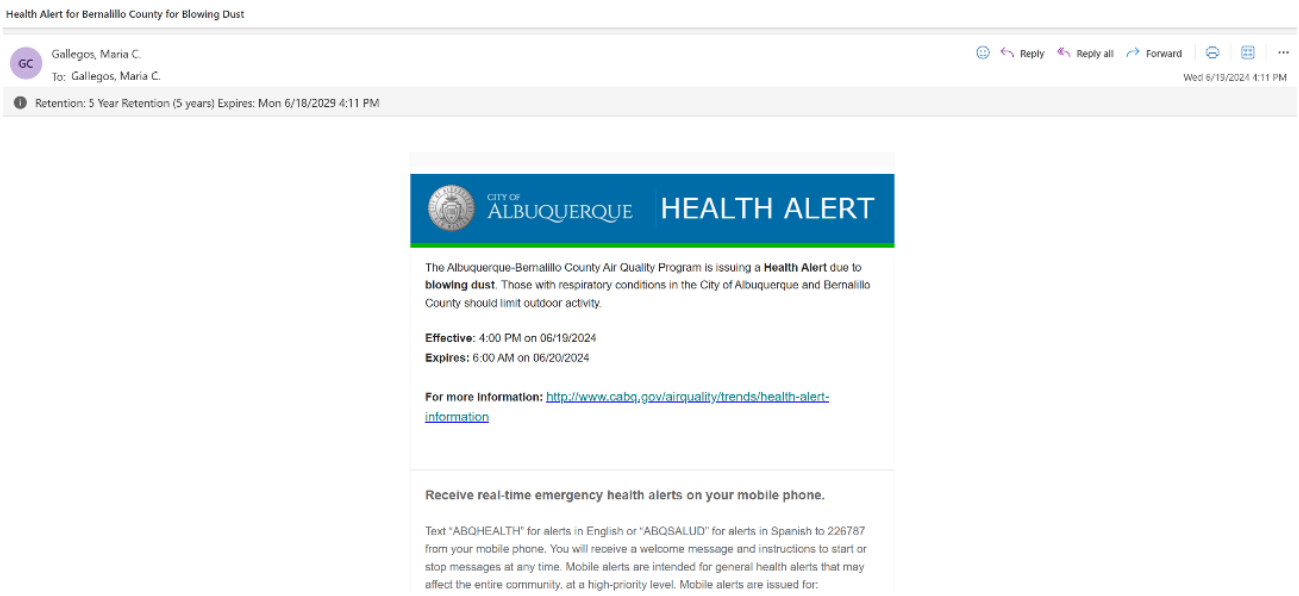

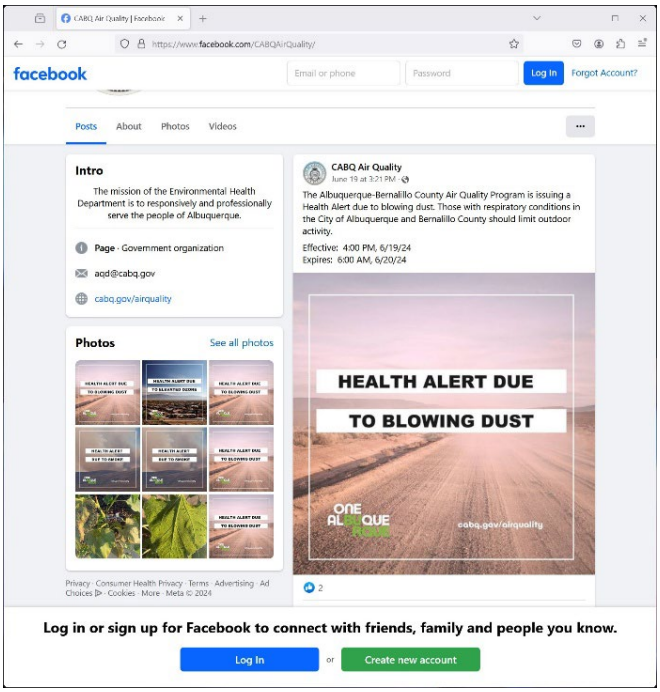

Figure 47: Health Alert for Bernalillo County Due to Blowing Dust Issued via E-mail, 6/19/2024, 4:11 PM MDT.

Public Education for Health Alert: The Exceptional Events Rule requires air agencies to provide public education on the exceptional event. This includes information about steps individuals can take to reduce their exposure to unhealthy air quality during and after the event. The AQP includes information on steps individuals can take to reduce their exposure during the event such as limiting outdoor activity.

The AQP utilizes a range of platforms for public notification and continuously conducts community outreach to educate and inform the public on ways to sign up to receive the public notifications.

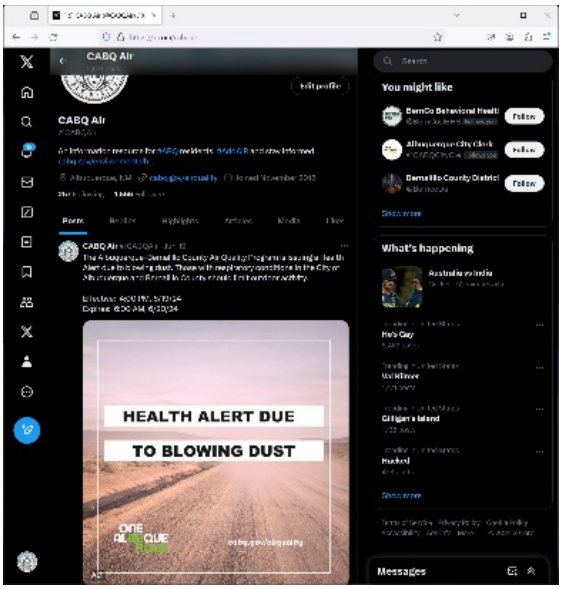

Figure 48: Health Alert Due to Blowing Dust issued on social media platforms, 6/19/2024

The AQP tracks and reviews the reports on analytics for the public notifications. The following are examples of analytics reports of the Program's platforms for public notification of the June 19, 2024 Exceptional Event.

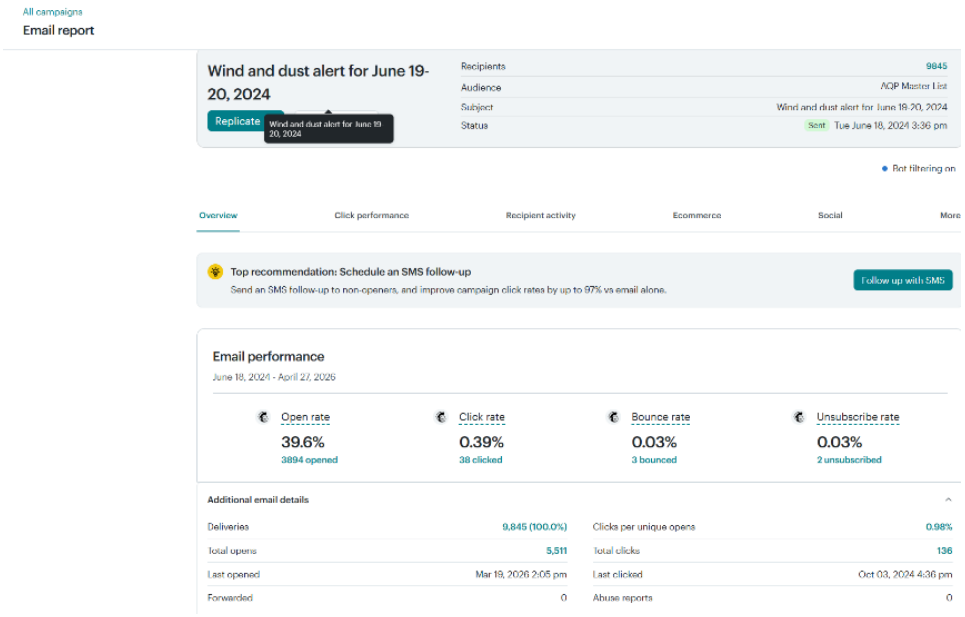

Figure 49: E-mail Campaign Report: Wind and Dust Forecast for 6/18/2024, 3:36PM MDT

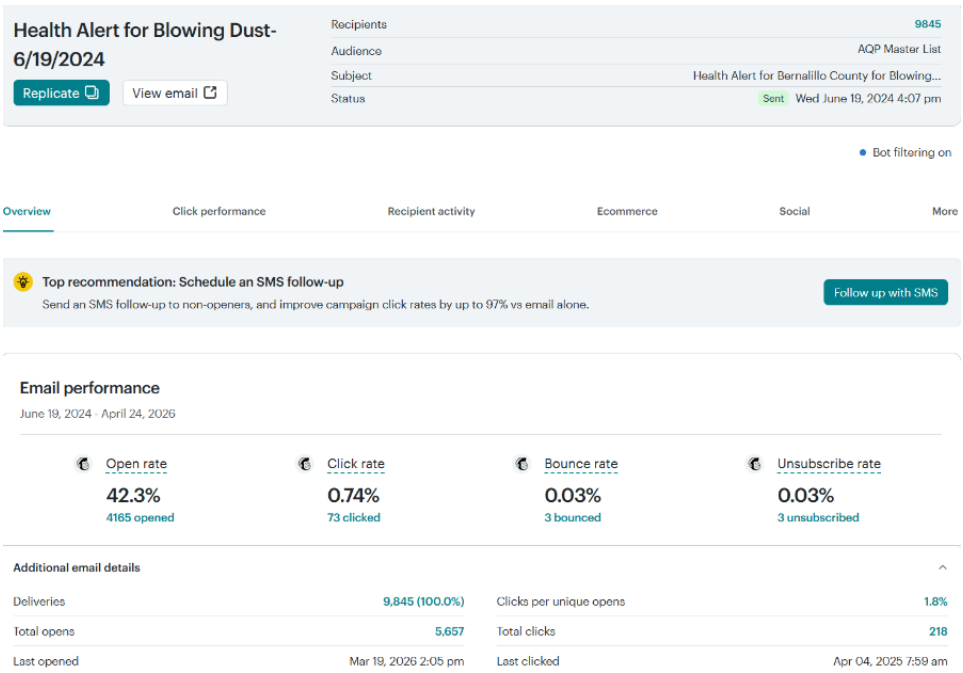

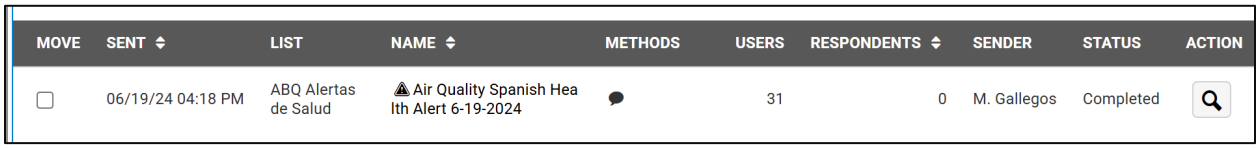

Figure 50: E-mail Campaign Report: Health Alert for Bernalillo County Due to Blowing Dust, 6/19/2024, 4:07 PM MDT.

Figure 51: RAVE Real Time Alerts Report: Health Alert 6/19/2024.

The AQP monitors local news outlets:

Standard protocol for the AQP is to send health alerts to the City's "Press Releases" listserv and monitor for media coverage.

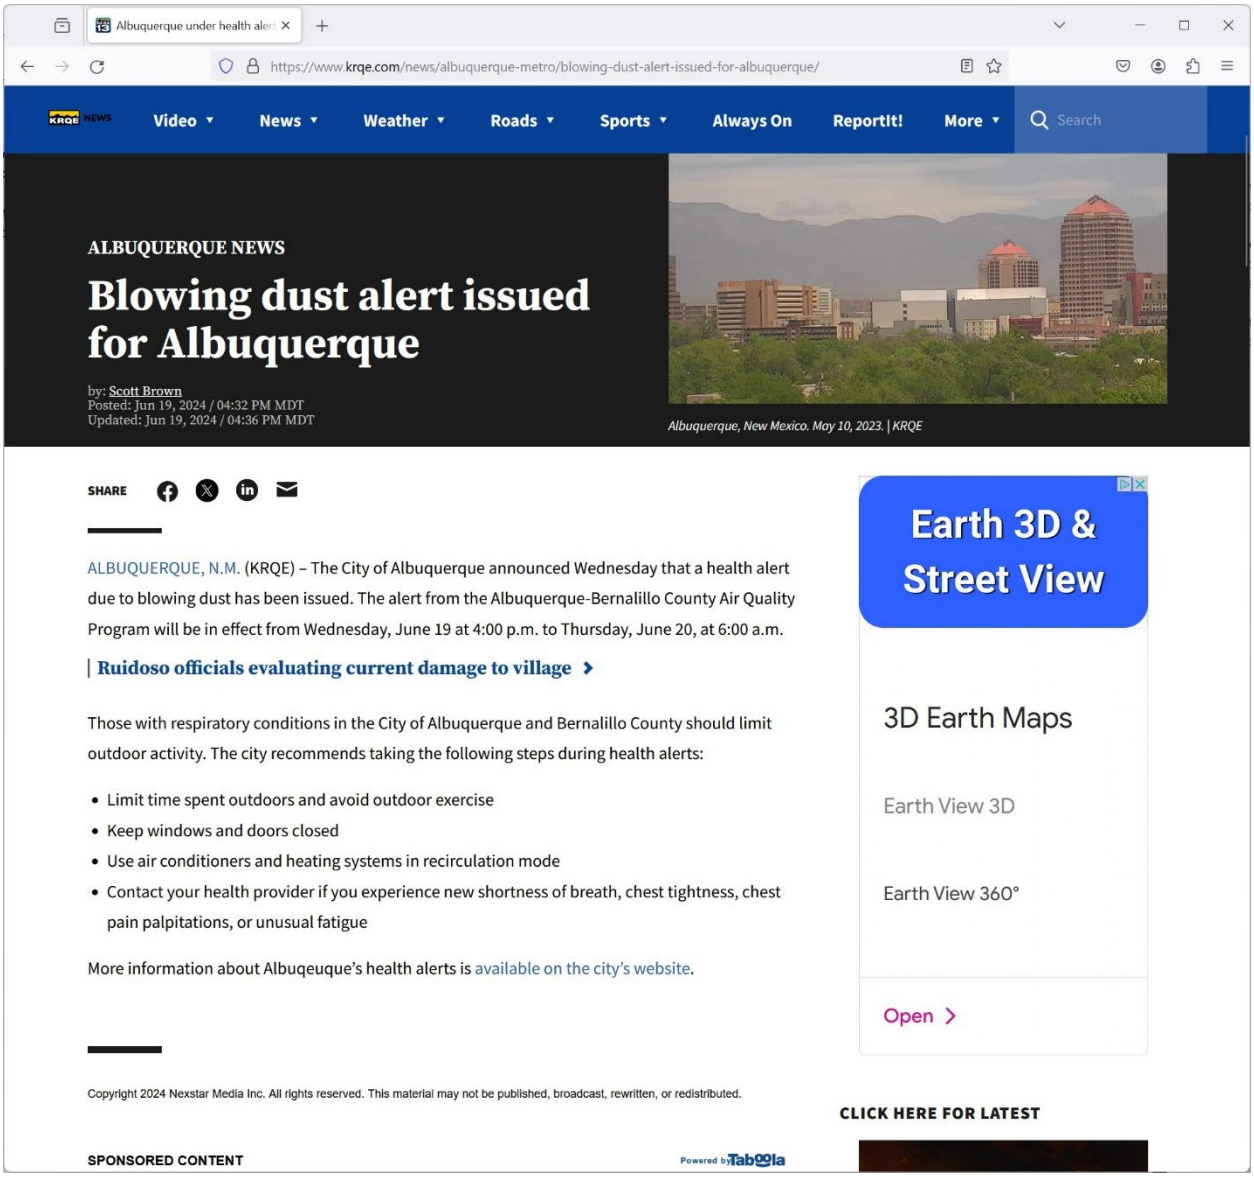

Figure 52: Local Media Coverage of Health Alert, 6/19/2024, 4:32PM MDT

Summary of Analysis

On June 19, 2024, Albuquerque's South Valley experienced a high wind dust event. Pursuant to EPA guidance on preparing exceptional event reports, this high wind dust event is best categorized as Tier 2. After being standardized to sea-level temperature and pressure, PM_{10} levels exceeded 800 µg/m^3 for ~~two~~ consecutive hours. The 24-hour average of ~~264~~ µg/m^3 exceeded the level of the NAAQS for PM_{10}. This monitored PM_{10} level ranked at the 99.5 percentile among all the 24-hour averages from the 2ZV monitor for 2024.

The high winds developed as rain-cooled air squeezed through Tijeras Canyon. The gap effect was manifested in the difference in wind speeds on the east versus west side of the central mountain chain. None of the upwind weather stations on the east side of New Mexico's central mountain chain reported wind or weather suggesting that dust was transported into Albuquerque. After the cold front associated with the rain-cooled air mass passed through KABQ, i.e. on the west side of the central mountain chain, the average sustained wind speed at KABQ was above 25 MPH for the last ten hours on June 19, 2024. In fact, the ten hourly KABQ observations from 1352 MST to 2252 MST all reported sustained wind speeds at or above 30 MPH.

Camera images and remarks in the KABQ weather observations reveal the blowing dust was widespread in the Albuquerque area. However, the 2ZV monitor was the only monitor in the Albuquerque area to exceed the level of the PM_{10} standard. Using both hourly and minute data, the Air Quality Program (AQP) demonstrated the temporal relationship between wind speed at KABQ and PM_{10} measurements at the 2ZV monitoring station. The AQP also demonstrated that the dust was generated locally, i.e. within its own jurisdiction.

A local regulation was created to limit fugitive dust in Bernalillo County. Pursuant to the regulation, permits with conditions are issued to potential sources of considerable fugitive dust. A stop work order (a.k.a. shutdown notice) was not issued to local contractors because this high wind dust event occurred after normal business hours.

The AQP issued a wind and dust forecast through e-mail to local contractors and businesses that generate dust. In addition to the high wind warning issued by the NWS, AQP staff issued a health alert for blowing dust through email, text, and social media.

Based on the documentation provided in this demonstration package, this event qualifies as a natural event. The June 19, 2024 violation associated with the event meets the regulatory definition of a natural event at 40 CFR 50.14(b)(8). This event transported windblown dust from anthropogenic sources within Bernalillo County, excluding Tribal lands, which were reasonably controlled at the time of the event. Accordingly, the AQP has demonstrated that the event is a natural event that should be considered for treatment as an exceptional event.

Addressing EE Demonstration Requirements

Requirements of 40 CFR Section 50.14, Treatment of air quality monitoring data influenced by exceptional events:

(3) Submission of Demonstrations

i. Except as provided under paragraph (c)(2)(vi) of this section, a State that has flagged data as being due to an exceptional event and is requesting exclusion of the affected measurement data shall, after notice and opportunity for public comment, submit a demonstration to justify data exclusion to the Administrator according to the schedule established under paragraph (c)(2)(i)(B).
ii. [Reserved]
iii. [Reserved]
iv. The demonstration to justify data exclusion must include:

A. A narrative conceptual model that describes the event(s) causing the exceedance or violation and a discussion of how emissions from the event(s) led to the exceedance or violation at the affected monitor(s);

RESPONSE: The AQP's documentation has provided a narrative conceptual model describing the high winds and the forces that generated such high winds. The AQP also discussed pre-existing conditions that influenced the event. The AQP also discussed the potential emission sources that contributed to the exceedance, how this impacted the monitor that exceeded the PM_{10} NAAQS, as well as the responses of the NWS and the AQP.

B. A demonstration that the event affected air quality in such a way that there exists a clear causal relationship between the specific event and the monitored exceedance or violation;

RESPONSE: The AQP, in this demonstration, has shown that the event affected air quality in such a way that there is a clear causal relationship between the event and the monitored exceedance of the PM_{10} NAAQS. Several of the example analysis types for Clear Causal Relationship from the April 2019 EPA Guidance for high wind dust event demonstrations were utilized. Wind speeds were elevated and meet the EER wind speed threshold. Most of the dust originated within Bernalillo County.

C. Analyses comparing the claimed event-influenced concentration(s) to concentrations at the same monitoring site at other times to support the requirement at paragraph (c)(3)(iv)(B) of this section. The Administrator shall not require a State to prove a specific percentile point in the distribution of data;

RESPONSE: The AQP has provided ample data comparisons that show the PM_{10} concentrations and wind speeds for this event deviate from what is normal for June. The AQP jurisdiction has a history of high wind dust events in the first and second quarters, but most of those events occur in the months before June. A mitigation plan was submitted to EPA Region 6 in April 2024 and approved on July 9, 2024.

D. A demonstration that the event was both not reasonably controllable and not reasonably preventable; and

RESPONSE: The AQP has provided information that Bernalillo County has reasonable control measures as noted by the adoption of Part 20-Fugitive Dust Control regulation. This regulation has full jurisdiction over all land within Bernalillo County with the exception of Tribal lands. Nonetheless, the AQP jurisdiction has a history of high wind dust exceptional events.

E. A demonstration that the event was a human activity that is unlikely to recur at a particular location or was a natural event.

RESPONSE: The AQP has recognized that the event was due to high winds and that the primary source of wind-borne dust was from anthropogenic sources. The high winds overwhelmed the reasonable controls implemented within the AQP's jurisdiction. This event met the definition of a natural event.

Conclusion

Based on the above analysis showing how the high wind event contributed to the exceedance, the AQP requests that EPA concur with this demonstration and exclude the above noted exceedance.

Appendix A

Initial Notification Letter

CITY OF ALBUQUERQUE

Environmental Health Department
Paul J. Rogers, Director

September 9, 2026

Dinesh Senghani, Acting Branch Chief for Air Permits
Air Monitoring & Grants Section
U.S. EPA, Region 6
1445 Ross Avenue, Suite 1200
Dallas, Tx 75202-2733

Dear Mr. Senghani,
Please consider this letter the City of Albuquerque's initial notification of intent to prepare the demonstration as a preliminary step before submitting a demonstration per the 2024 Exceptional Events Rule (EER) effective September 30, 2016. These demonstrations will address high wind events which occurred as site 35-001-0029 (South Valley) for parameter 81102 (PM_{10}) on:

Date	PM_{10} Concentration
06/19/2024	264µg/m3

This event can be considered as having regulatory significance. Attached are the AQS AMP300, AMP350 & AMP435 reports. Our agency looks forward to collaborating with EPA Region 6 to establish a timeframe for the demonstrations.

Appendix B

Fugitive Dust Regulation- 20.11.20 NMAC

TITLE 20 ENVIRONMENTAL PROTECTION
CHAPTER 11 ALBUQUERQUE - BERNALILLO COUNTY AIR QUALITY CONTROL BOARD
PART 20 FUGITIVE DUST CONTROL

20.11.20.1 ISSUING AGENCY: Albuquerque - Bernalillo County Air Quality Control Board. P.O. Box 1293, Albuquerque, New Mexico 87103. Telephone: (505) 768-2601.
[20.11.20.1 NMAC - Rp, 20.11.20.1 NMAC, 9/9/2025]

20.11.20.2 SCOPE:

A. 20.11.20 NMAC is applicable to all sources of fugitive dust in Bernalillo county, unless otherwise exempt.

B. Exempt: 20.11.20 NMAC does not apply to sources within Bernalillo county that are:

(1) located on Indian lands over which the Albuquerque - Bernalillo county air quality control board lacks jurisdiction;

(2) hard rock mining pits and operations contained within the mining pit and permitted pursuant to the state of New Mexico Mining Act; for the purposes of 20.11.20 NMAC, sand and gravel mining operations are not exempt;

(3) emergency maintenance operations that are intended to address an imminent threat to property or persons; however, reasonably available control measures must be employed once the emergency has been addressed, if appropriate, and a report of all activities shall be filed with the department no later than 10 days after the incident has been concluded and the department shall determine if additional action, including a permit application submittal, is required before additional non-emergency activities occur at the site; and

(4) stationary source operations subject to 20.11.41 NMAC, *Authority to Construct*, or 20.11.42 NMAC, *Operating Permits*, that produce fugitive dust as defined in 20.11.20 NMAC, but only if the source of fugitive dust is addressed and controlled through permit conditions required by a 20.11.41 NMAC or 20.11.42 NMAC permit; however construction at a stationary source site, whether it involves new construction or a site modification, is subject to 20.11.20 NMAC.

C. Conditionally Exempt: The following five sources of fugitive dust emissions in Bernalillo county shall be conditionally exempt from the requirements of 20.11.20 NMAC, unless the department determines that the fugitive dust emitted from a conditionally exempt source's active operations or inactive disturbed surface area may adversely and significantly affect human health within Bernalillo county:

(1) areas zoned for agriculture and used for growing a crop;

(2) bicycle trails, hiking paths and pedestrian paths, horse trails or similar paths used exclusively for purposes other than travel by motor vehicles;

(3) unpaved roadways on privately-owned easements serving residential dwellings;

(4) lots smaller than three-quarters of an acre used for any purpose; and

(5) unpaved roadways within properties used for ranching, or properties owned or controlled by the United States department of energy or department of defense, or United States department of agriculture forest service lands or United States department of interior park service lands if the public does not have motor vehicle access to the roadways.

[20.11.20.2 NMAC - Rp, 20.11.20.2 NMAC, 9/9/2025]

20.11.20.3 STATUTORY AUTHORITY: 20.11.20 NMAC is adopted pursuant to the authority provided in the New Mexico Air Quality Control Act, Sections 74-2-4 & 74-2-5 NMSA 1978; the Joint Air Quality Control Board Ordinance; Bernalillo county Ordinance No. 94-5, Sections 4 and 5; and the Joint Air Quality Control Board Ordinance, Revised Ordinances of Albuquerque 1994 Sections 9-5-1-4 and 9-5-1-5.
[20.11.20.3 NMAC - Rp, 20.11.20.3 NMAC, 9/9/2025]

20.11.20.4 DURATION: Permanent.
[20.11.20.4 NMAC - Rp, 20.11.20.4 NMAC, 9/9/2025]

20.11.20.5 EFFECTIVE DATE: September 9, 2025, unless a later date is cited at the end of a section.
[20.11.20.5 NMAC - Rp, 20.11.20.5 NMAC, 9/9/2025]

20.11.20.6 OBJECTIVE: To ensure that every person shall use reasonably available control measures or other effective measures on an ongoing basis to prevent or abate fugitive dust, if the fugitive dust may with

reasonable probability injure human health or animal or plant life or as may unreasonably interfere with the public welfare, visibility or the reasonable use of property, as required by 20.11.20 NMAC.
[20.11.20.6 NMAC - Rp, 20.11.20.6 NMAC, 9/9/2025]

20.11.20.7 DEFINITIONS: In addition to the definitions in 20.11.20.7 NMAC, the definitions in 20.11.1 NMAC apply unless there is a conflict between definitions, in which case the definition in 20.11.20.7 NMAC shall govern.

A. "Accredited" or "accreditation" when referring to a person or laboratory means that such person or laboratory is accredited in accordance with Section 206 of Title II of the Toxic Substances Control Act, 15 U.S.C. 2601, *et seq.*

B. "Active operations" means any anthropogenic activity that is capable of generating, or generates fugitive dust, including but not limited to: bulk material storage, handling or processing; earth moving; soil or surface disturbance (e.g. discing, trenching, blading, scraping, clearing, grubbing, topsoil removal); construction, renovation, or demolition activities; movement of motorized vehicles on any paved or unpaved roadway or surface, right-of-way, lot or parking area; or the tracking out or transport of bulk material onto any paved or unpaved roadway.

C. "Anthropogenic" means human-caused changes in the natural or built condition of the environment.

D. "Bulk material" means sand, gravel, soil, aggregate or any other inorganic or organic solid material capable of creating fugitive dust.

E. "Business day" means Monday through Friday, except city of Albuquerque holidays.

F. "Construction activity" means any activity preparatory to or related to building, altering, rehabilitating, demolishing or improving property that results in a disturbed surface area, including but not limited to grading, excavation, loading, crushing, pavement milling, cutting, clearing, grubbing, topsoil removal, blading, shaping, dry sweeping, blasting and ground breaking.

G. "Crop" means an agricultural plant harvested for consumption, utilization or sale.

H. "Disturbed surface area" or "surface disturbance" means the natural or manmade area of the earth's surface that, as a result of anthropogenic activity, may become a source of transported material, track-out, or visible fugitive dust.

I. "Division" means the city of Albuquerque air quality division or its successor agency.

J. "Dust suppressant" means hygroscopic materials, or non-toxic chemical stabilizers used to reduce or control fugitive dust emissions during suspended operations and as a long term reasonably available control measure.

K. "Earth moving activity" means grading, cutting, filling, soil disturbance (e.g. discing, trenching, blading, scraping, clearing, topsoil removal, grubbing), soil mulching, loading or unloading of dirt or other bulk materials, including adding to or removing from open storage piles or stockpiles of bulk materials.

L. "Fugitive dust" or "dust" means organic or inorganic particulate matter. Water vapor, steam, or particulate matter emissions emanating from a duct or stack of process equipment are not fugitive dust.

M. "Fugitive dust control construction permit" or "permit" means a fugitive dust control permit approved by the department and issued pursuant to 20.11.20 NMAC that contains an approved fugitive dust control plan and authorizes active operations to begin when the permit is signed by a division manager, supervisor, scientist, field operations officer or health specialist.

N. "Fugitive dust control plan" or "plan" means the part or portion of the fugitive dust control construction permit or programmatic permit application that details the reasonably available control measures and other effective measures the permit applicant commits to use to reduce the quantity of visible fugitive dust, transported material, or track-out leaving the property or area under the control of the permittee and shall include contingency fugitive dust control measures, which shall be a requirement of every fugitive dust control permit.

O. "Greenwaste" means organic matter including, grass clippings, leaves, weeds, small shrub or tree limb cuttings, brush, stumps, and soils.

P. "High wind event" means a condition announced by the department consisting of wind speeds of approximately 30 miles per hour or greater that, when accompanied by dry soil conditions, that is likely to result in widespread reduced visibility due to blowing fugitive dust and that may result in elevated monitored particulate levels that may cause or contribute to an exceedance or violation of the national ambient air quality standards.

Q. "Inactive disturbed surface area" means any disturbed surface area on which active operations have been suspended.

R. "Large area disturbance" means a project or development, totaling more than 25 acres upon which active operations have been conducted and includes areas used for storage of bulk material, building or construction materials, machinery or vehicles.

S. "Open storage pile" means the accumulation of bulk material that is not fully enclosed, covered or chemically stabilized.

T. "Owner or operator" means a person who owns, leases, operates, controls, or supervises a source that directly or indirectly produces or is capable of producing fugitive dust.

U. "Parking lot" or "parking area" means a location where motor vehicles routinely park whether or not the area is zoned for parking.

V. "Paved" or "paving" or "paved roadway" means asphalt, recycled asphalt, concrete or asphaltic concrete, routinely-maintained asphalt millings, or combinations thereof, that cover a surface traveled or used by motor vehicles.

W. "Permittee" means a person and all legal heirs, successors, and assigns who has applied for and obtained a fugitive dust control construction or programmatic permit issued by the department pursuant to 20.11.20 NMAC.

X. "Person" means an individual, firm, partnership, corporation, association, organization, company, joint stock association, business trust, owner, or body politic, including a municipality, local, state or federal government agency or political subdivision, and includes an employee, officer, operator, contractor, supplier, installer, user, leaseholder, trustee, receiver, assignee or other person acting in a similar representative capacity with the authority to control transported material or emissions of particulate matter generated at a disturbed surface area or generated by activities associated with a disturbed surface area or inactive disturbed surface area.

Y. "Privately-owned" means real property that is not wholly or partially owned, leased or otherwise controlled by a federal, state or local government or governmental agency or political subdivision.

Z. "Programmatic permit" means a fugitive dust control permit valid for up to five years issued to a permittee that performs routine maintenance or routine ongoing active operations on real property, but does not include full depth reconstruction of a roadway or substantial removal and replacement of a manmade facility. A programmatic permit shall include an approved fugitive dust control plan and shall be effective when signed by a division manager, supervisor, scientist, field operations officer or health specialist.

AA. "Property line" means the exterior boundary of real property, as indicated by plats, plot maps or other indication of ownership limits.

BB. "Publicly-maintained" means under the jurisdiction of, or maintained by a federal, state, or local government or governmental agency or political subdivision.

CC. "Publicly-owned" means real property that is wholly or partially owned, leased or otherwise controlled by a federal, state or local government or governmental agency or political subdivision. Publicly-owned real property includes easements and rights-of-ways, streets, roadways, sidewalks, alleys and other public ways, parks, irrigation and drainage facilities, and any other publicly controlled real property that can be the source of fugitive dust.

DD. "Reasonably available control measure" or "control measure" means a device, system, process modification, apparatus, technique, work practice, or combination thereof, that mitigates fugitive dust and includes the measures in 20.11.20.23 NMAC and any other regulatory control program that results in equivalent protection of a disturbed surface or inactive disturbed surface area, whether or not the purpose of the control measure is to mitigate dust or to meet another requirement of 20.11.20 NMAC or any other statute or regulation.

EE. "Responsible person" means the person designated in a fugitive dust control permit application or permit amendment who agrees to be and shall be responsible for complying with 20.11.20 NMAC, and with the permit and plan to the extent specified in the permit.

FF. "Short cut" means a non-dedicated roadway or route used by motor vehicle drivers to save time by avoiding use of a dedicated and authorized roadway.

GG. "Silt" means bulk material that passes through a 200-mesh screen using the ASTM-D 2487-93, "*classification of soils for engineering purposes (united soil classification system*)" method, or most current ASTM (American society for testing and materials) method. Material that will pass through a 200-mesh screen is 74 microns or less in size.

HH. "Source" or "source of fugitive emissions" means the origin of fugitive dust emissions.

II. "Stabilized" or "stabilization" means ongoing practices that are sufficient to prevent elevated monitored particulate levels that may cause or contribute to an exceedance or violation of the national ambient air quality standards by meeting the objective established in 20.11.20.6 NMAC and the requirements of the general provisions established in 20.11.20.12 NMAC.

JJ. "Stockpile" means the depositing of bulk material by mechanical means for the purpose of creating a pile formation on top of an existing natural or man-made surface.

KK. "Stop work order" means an order issued by the department pursuant to the provisions of 20.11.20 NMAC that requires a person to cease active operations.

LL. "Track-out" or "tracking" means bulk material deposited by a motor vehicle or vehicles upon an unpaved or paved publicly or privately owned roadway if the bulk material can become airborne due to mechanical or wind action.

MM. "Transfer of permit" means an agreement approved in writing by the department that meets the conditions outlined in Paragraphs (1) through (6) of Subsection D of 20.11.20.14 NMAC.

NN. "Transported material" means particulate matter transported by wind, water or other action that, once deposited, can become airborne due to mechanical or wind action.

OO. "Unpaved roadway" means an unpaved route traveled by a motorized vehicle.

PP. "Visible fugitive dust" means airborne particulate matter from a source, resulting in particulate matter emissions that can be detected by the human eye or a detection method approved by the department. Visible fugitive dust can be an indicator of PM_{10}.

QQ. "Visible fugitive dust detection method" means the method described in 20.11.20.26 NMAC, which is one method used to determine compliance with 20.11.20 NMAC.

[20.11.20.7 NMAC - Rp, 20.11.20.7 NMAC, 9/9/2025]

20.11.20.8 VARIANCES: A person may request a variance from 20.11.20 NMAC in accordance with the procedures established in 20.11.7 NMAC.

[20.11.20.8 NMAC - Rp, 20.11.20.8 NMAC, 9/9/2025]

20.11.20.9 SAVINGS CLAUSE: An amendment to *Fugitive Dust Control*, 20.11.20 NMAC, which is filed with the state records center and archives shall not affect actions pending for violation of a city or county ordinance, or prior versions of 20 NMAC 11.20 and 20.11.20 NMAC, *Airborne Particulate Matter*, 20.11.20 NMAC *Fugitive Dust Control*, or a permit. Prosecution for a violation of a prior statute, ordinance, part or permit shall be governed and prosecuted under the statute, ordinance, part or permit wording in effect at the time the violation was committed.

[20.11.20.9 NMAC - Rp, 20.11.20.9 NMAC, 9/9/2025]

20.11.20.10 SEVERABILITY: If any section, subsection, sentence, phrase, clause or wording of 20.11.20 NMAC or the federal standards incorporated herein is for any reason held to be unconstitutional or otherwise invalid by any court or the United States environmental protection agency, the decision shall not affect the validity of remaining portions of 20.11.20 NMAC.

[20.11.20.10 NMAC - Rp, 20.11.20.10 NMAC, 9/9/2025]

20.11.20.11 DOCUMENTS: Documents incorporated and cited in 20.11.20 NMAC may be viewed at the Albuquerque environmental health department, 400 Marquette NW, Albuquerque, NM.

[20.10.20.11 NMAC - Rp, 20.11.20.11 NMAC, 9/9/2025]

20.11.20.12 GENERAL PROVISIONS:

A. Each person shall use reasonably available control measures or any other effective control measure during active operations or on inactive disturbed surface areas, as necessary to prevent the release of fugitive dust, whether or not the person is required by 20.11.20 NMAC to obtain a fugitive dust control permit. It shall be a violation of 20.11.20 NMAC to allow fugitive dust, track out, or transported material from any active operation, open storage pile, stockpile, paved or unpaved roadway disturbed surface area, or inactive disturbed surface area to cross or be carried beyond the property line, right-of-way, easement or any other area under control of the person generating or allowing the fugitive dust if the fugitive dust may:

(1) with reasonable probability injure human health or animal or plant life;

(2) unreasonably interfere with the public welfare, visibility or the reasonable use of property; or

(3) be visible for a total of 15 minutes or more during any consecutive one hour observation period using the visible fugitive dust detection method in 20.11.20.26 NMAC or an equivalent method approved in writing by the department.

B. Failure to comply with 20.11.20.12 NMAC, a fugitive dust control permit, plan, term or condition shall be a violation of 20.11.20 NMAC.

C. Prior to issuing a fugitive dust control construction permit authorizing commencement of active operations, the department shall:

(1) document, in the form of photographs in electronic or hard copy formats or video recordings, the conditions of the properties that are closest to the property subject to the permit and any other properties the department believes are appropriate;

(2) maintain the documentation for one year after completion of the permitted project;

(3) include in the permit a requirement that the permittee remedy damage to real properties caused by a violation of the permit; and

(4) make the documentation available as evidence, upon request, to all parties involved in a property damage dispute allegedly caused by fugitive dust.

D. A permittee whose violation of 20.11.20 NMAC results in fugitive dust being deposited upon real property beyond the limits of the permitted area shall take all actions necessary to remedy damage caused by a violation proven with credible evidence. Such remedies may include, but not be limited to, compensation, removal of the fugitive dust and/or repair of any damage after obtaining permission from property owners or operators before doing any remedial work on the damaged property. It shall be a separate violation of 20.11.20 NMAC to fail to remove the fugitive dust and repair the damage as specified in a written schedule or any extension agreed to by the permittee and the owner of the damaged property. If the parties cannot agree to a schedule, the department may establish deadlines and failure to comply with the deadlines shall be a separate violation of 20.11.20 NMAC. No violation will occur if the failure to perform the corrective action is for reasons beyond the control of the person performing the work including without limitation acts of God or government preemption in connection with a national emergency or if the owner of the allegedly damaged property refuses to grant reasonable permission and access to conduct the remediation activities.

E. Stockpiles shall be no higher than 15 feet above the existing natural or man-made grade that abuts the stockpile, unless otherwise approved in advance and in writing by the department.

F. Each person shall comply with all applicable provisions of the Clean Air Act, the New Mexico Air Quality Control Act, joint air quality control board ordinances, regulations of the board, and permits issued by the department.

[20.11.20.12 NMAC - Rp, 20.11.20.12 NMAC, 9/9/2025]

20.11.20.13 FUGITIVE DUST CONTROL PROGRAMMATIC PERMITS:

A. A fugitive dust control programmatic permit is required for single or multiple facility locations to address real property totaling three-quarters of an acre or more that is subject to routine maintenance, routine surface disturbance activities, or routine ongoing active operations. A programmatic permit application and fugitive dust control plan shall be submitted on forms provided by the department. Programmatic permits are valid for up to five years. The permittee shall pay the annual programmatic permit fee required by 20.11.2 NMAC, *Fees*, for each year covered by the programmatic permit. Receipt of the annual fee by the department shall result in an automatic annual renewal of the programmatic permit. A new programmatic permit application and fugitive dust control plan shall be submitted every five years or sooner if the surface disturbance activities or fugitive dust abatement strategies are modified. A filing and review fee is not required for a programmatic permit.

B. A person responsible for sloped (i.e. slopes having a steepness of three-to-one or steeper) and bottom portions of interior and riverside drains and canals used for irrigation purposes, and arroyos and public flood control facilities subject to routine maintenance or repair, sedimentation and water erosion shall obtain either a variance as provided by 20.11.7 NMAC or a programmatic permit as provided by Subsection A of 20.11.20.13 NMAC if the person does not elect to submit an application and obtain a fugitive dust control construction permit pursuant to 20.11.20.14 NMAC.

C. No signs or photographic documentation shall be required for the permits or activities subject to 20.11.20.13 NMAC. Appropriate permit application documentation shall be determined by the department.

[20.11.20.13 NMAC - Rp, 20.11.20.13 NMAC, 9/9/2025]

20.11.20.14 FUGITIVE DUST CONTROL CONSTRUCTION PERMITS:

A. A person who does not elect to obtain or who does not qualify for a fugitive dust control programmatic permit pursuant to 20.11.20.13 NMAC and who plans to conduct active operations that will disturb three-quarters of an acre or more shall comply with either Subsection A or B of 20.11.20.18 NMAC and obtain a fugitive dust control construction permit. No active operations shall commence until a department manager, supervisor, scientist, field operations officer or health specialist signs the fugitive dust control construction permit (permit) and a copy of the signed permit is available at the site of active operations. A permit shall consist of a

complete permit application a fugitive dust control plan, any appended documents, any conditions attached to the permit by the department, and a signature and effective date affixed by a department manager, supervisor, scientist, field operations officer or health specialist.

B. The permittee shall comply with the terms of the permit unless the department approves a transfer of the permit or issues a new permit for the active or inactive disturbed surface area of operation to a new permittee. If three-quarters of an acre or more of the real property that is subject to the permit is transferred or sold the new owner is responsible for complying with either 20.11.20.13 NMAC or 20.11.20.14 NMAC unless exempt. Upon receipt of an amended permit signed by a department manager, supervisor, scientist, field operations officer or health specialist, the permittee who transferred or sold the real property no longer will be responsible for control of fugitive dust originating from the real property that has been transferred or sold. Permit amendment fees shall be paid as required by 20.11.20.14 NMAC.

C. If a person other than the permittee will be responsible for complying with the permit and 20.11.20 NMAC, then the permittee shall designate the responsible person or persons in the permit application who shall be responsible for active operations and inactive disturbed surface areas to the extent specified in the application. Before a responsible person shall be liable for a violation of the permit or 20.11.20 NMAC, the responsible person shall agree in writing to accept responsibility for compliance with the permit conditions. The responsible person shall be the first person the department attempts to contact regarding a violation of the permit or 20.11.20 NMAC. In addition, the department may approve, in writing, a permit amendment that adds or changes the responsible person who has agreed in writing to be responsible for complying with the permit and plan, to the extent specified in the permit. If the responsible person and permittee fail to comply with the provisions of 20.11.20 NMAC, the owner or operator, if different from the responsible person or permittee, shall be responsible for compliance with the permit.

D. An approved permit shall be valid for one year from the date of issuance by the department or until the project expiration date provided in the permit application, whichever is longer, but no more than five years from the date of issuance. If the project plan, expiration date, total disturbed surface area, completion date or the proposed control measures change in any manner, an amended or new permit is required. At least 10 business days before the expiration date, a fugitive dust control permit shall be renewed by the then-current permittee, or the permit shall expire as of the expiration date. Permit amendment or renewal fees shall be paid as required by Subsection H of 20.11.20.14 NMAC. Permits may be transferred to legal heirs, successors, and assigns, who shall become the new permittee. Permit transfers may qualify as an administrative amendment if:

(1) the department has received, on a form provided by the department, a written transfer agreement signed by the current and new permittee, and, if different than the new permittee, by the owner of the real property subject to the permit;

(2) a specific date of the transfer of the permit and plan responsibility, coverage, and liability is established in the transfer agreement;

(3) the department has determined that no change to the permit and plan other than the administrative change is necessary;

(4) the new permittee and owner have submitted the application information required by 20.11.20.15 NMAC if changes have been made to the permit and plan as deemed necessary by the department;

(5) no grounds exist for permit termination, as otherwise provided by 20.11.20 NMAC; and

(6) the transfer agreement has been approved in writing by the department.

E. After a permit is issued and before the start of active operations, the permittee shall install and maintain a project sign provided by the department or a project sign that meets the requirement of 20.11.20.14 NMAC. The department will establish uniform design guidelines for the sign to ensure that the sign is reasonably legible to the public. If the required information is provided in an existing project sign that has been established for another purpose, an additional sign shall not be required to comply with 20.11.20 NMAC. At a minimum, the sign shall contain the following:

(1) project name;

(2) permittee name;

(3) phone number of designated responsible person or owner;

(4) subcontractor name (optional);

(5) subcontractor phone number (optional);

(6) air quality division phone number;

(7) fugitive dust control permit number; and

(8) total acres of area to be disturbed.

F. The permittee or responsible person shall make the permit available to all employees, agents, sub-contractors, and other persons performing work in the area of active operations or inactive disturbed surface areas to assist in maintaining compliance with 20.11.20 NMAC. The permittee or responsible person shall explain the requirements of the permit to appropriate employees, contractors and agents working at the site. Upon request, the permittee shall provide information regarding how to obtain a copy of the permit from the department.

G. It is the responsibility of the permittee or responsible person to ensure that the permit or amended permit contains current contact information and that a copy is maintained at the work site and is provided to the department upon request. Failure to maintain and provide up-to-date contact information shall be a violation of 20.11.20 NMAC.

H. The department may amend or renew the permit if requested to do so by the permittee. No fee shall be charged for amending or renewing a permit, unless there will be an increase in the number of acres subject to surface disturbance. Both the department and the permittee must sign an amended permit before it will be effective. The department is not required to sign a renewed permit unless the renewed permit increases the number of acres subject to surface disturbance. An amended or renewed permit that involves an increase in the number of acres subject to surface disturbance shall require payment of fees as required by 20.11.2 NMAC.
[20.11.20.14 NMAC - Rp, 20.11.20.14 NMAC, 9/9/2025]

20.11.20.15 FUGITIVE DUST CONTROL CONSTRUCTION PERMITS; MINIMUM PERMIT APPLICATION REQUIREMENTS: Proposed fugitive dust control construction permit applications shall be submitted on forms provided by the department. Fugitive dust control plans may be submitted in any format including a copy of a program that complies with any other statute or regulation so long as the plan provides reasonably available control measures whose purpose is to mitigate fugitive dust and the plan meets the objectives of 20.11.20 NMAC. If extraneous information is supplied that does not apply to mitigation of fugitive dust, then the dust control measures shall be clearly identified in the plan or the permit application shall be deemed incomplete and shall be rejected. An incomplete permit application shall be processed as described in Subsection C of 20.11.20.18 NMAC. Proposed fugitive dust control permit applications shall include the following:

A. name, address, telephone number and fax number of permittee;

B. owner's name, address, telephone number and fax number if different from permittee;

C. if different than the permittee, the name, address, telephone number and fax number of the responsible person who is agreeing to, and shall be responsible for activities on the permitted site; the department shall first attempt to contact the responsible person regarding a violation of the permit;

D. anticipated project start date which shall be no fewer than 10 business days from the department's receipt of the permit application for areas containing greater than three quarters of an acre but no greater than 25 acres, and no fewer than 20 business days from the department's receipt of the permit application for areas containing more than 25 acres;

E. anticipated project completion date;

F. project description;

G. project location including, if available, street address, major cross streets or nearby intersection;

H. total area of disturbance in acres or square feet;

I. a check or money order for the fees due, calculated using the tables provided on the permit application form, payable to the 'city of Albuquerque permits program' (fund 242);

J. a description of the sequencing of the active operations, if phasing is used to reduce the total disturbed area at any time;

K. estimated total volume of bulk material being handled in cubic yards, including any bulk material being imported, exported or relocated;

L. location from which bulk material is being imported to the site and a statement regarding whether the site where the imported material originates will have a separate fugitive dust control permit, or provide written information to the department as soon as known;

M. location to which bulk material from the site is being exported and a statement regarding whether the site to which the material is to be exported will have a separate fugitive dust control permit, or provide written information to the department as soon as known;

N. whether an approved drainage plan exists pursuant to city of Albuquerque or Bernalillo county ordinances and, upon request by the department, provide a copy of the drainage plan;

O. site map (e.g. zone atlas page, aerial photograph);

P. type of work being performed and appropriate reasonably available control measures, as described in 20.11.20.23 NMAC, or other effective control measures proposed to be used in the fugitive dust control plan;

Q. a statement that effective contingency fugitive dust control measures shall be taken by the permittee if the control measures required by Subsection P of 20.11.20.15 NMAC are not effective in maintaining compliance with 20.11.20 NMAC;

R. a commitment to comply with provisions of Subsection B of 20.11.20.16 NMAC if the permittee chooses to preserve the ability to qualify for a high wind affirmative defense;

S. high wind contingency measures that will be implemented when high winds occur;

T. a description of the actions the permittee will take to mitigate damage caused by fugitive dust if generated by active operations or an inactive disturbed surface area on the permitted site;

U. other proposed conditions;

V. signature of the permittee, and, if a different person, signature of the owner, operator and/or any responsible person certifying that the information in the fugitive dust control permit application is true, accurate and complete, and certifying that all actions necessary to comply with 20.11.20 NMAC will be taken, including suspending active operations if necessary to comply with the provisions of 20.11.20 NMAC; and

W. a statement regarding whether bulk material will be stockpiled at the project site, the dimension of each stockpile, and the reasonably available control measures or other effective control measures that will be used at the stockpile area to comply with 20.11.20 NMAC.

[20.11.20.15 NMAC - Rp, 20.11.20.15 NMAC, 9/9/2025]

20.11.20.16 HIGH WIND EVENT REQUIREMENTS; HIGH WIND EVENT AFFIRMATIVE DEFENSE:

A. General requirements: during a high wind event, all persons responsible for fugitive dust control activities on publicly or privately-owned real property where active operations are occurring or inactive disturbed surface areas exist shall use reasonably available control measures or other effective measures to prevent fugitive dust from leaving the property. All such persons shall implement the control measure required by Paragraph (5) of Subsection C, of 20.11.20.16 NMAC.

B. High wind affirmative defense: if the department initiates an administrative enforcement action against either a permittee or a responsible person, or both (respondent) alleging a violation of a permit or 20.11.20 NMAC during a high wind event, the respondent may assert an affirmative defense in the enforcement action if the respondent establishes by credible evidence that respondent complied with the requirements established in Subsection C of 20.11.20.16 NMAC. In order to successfully assert the affirmative defense, during the entire duration of a permit the respondent shall utilize the applicable controls described in Subsection C of 20.11.20.16 NMAC, regardless of whether or not a high wind event exists, with the exception of Paragraph (5) of Subsection C of 20.11.20.16 NMAC, which shall be required during a high wind event. The affirmative defense shall not be available if respondent has failed to diligently perform the control measures specified in Paragraphs (1) through (5) of Subsection C of 20.11.20.16 NMAC. The availability of the affirmative defense shall not change the respondent's potential liability for any damage caused by fugitive dust leaving the permitted property, and the affirmative defense shall not change the permittee's obligation to remove fugitive dust originating from the permitted source, or otherwise remedy the damage, as required by Subsection D of 20.11.20.12 NMAC. The board, its members, and employees and officials of the city of Albuquerque and the county of Bernalillo shall not incur individual liability for damage to persons or property caused by fugitive dust leaving the permitted property.

C. Mandatory control measures: to assert a high wind event affirmative defense as described in Subsection B of 20.11.20.16 NMAC, a permittee shall utilize the applicable control measures in Paragraphs (1) and (2) of Subsection C of 20.11.20.16 NMAC on an ongoing basis. Without prior notice to the department, the permittee may use the measure in Paragraph (3) of Subsection C of 20.11.20.16 NMAC in place of the measure in Paragraph (1) of Subsection C of 20.11.20.16 NMAC. After receiving written permission from the department, the permittee may substitute the measures in Paragraph (4) for the measures in Paragraphs (1) and (2), or (2) and (3) of Subsection C of 20.11.20.16 NMAC. All permittees, whether or not they intend to assert a high wind affirmative defense, shall implement the measure in Paragraph (5) of Subsection C of 20.11.20.16 NMAC during a high wind event.

(1) Use of wet suppression sufficient to attain and maintain eighty percent of the optimal moisture content of the soil as determined by a proctor analysis performed by a certified public or private materials testing laboratory. For proctor analyses, either the standard proctor (ASTM D-698) or the modified proctor (ASTM D-1557) may be used. Daily, representative testing of the soil moisture content shall be taken on exposed new surfaces after the top one-half to one inch of the soil is removed at the sampling area. Three times each day, at intervals that are equally spaced throughout the work day, the respondent shall test and record the soil moisture content at three separate representative locations on the permitted property, which will result in a minimum of nine

tests each day. To demonstrate compliance, any set of three tests shall average 80 percent of the optimal moisture content of the soil and no individual test shall be less than 70 percent of the optimal moisture content of the soil. Failure to meet the soil moisture content standards as required by Subsection C of 20.11.20.16 NMAC for any set of three tests shall require that the respondent immediately apply necessary control measures at the portion or portions of the representative area where the soil moisture content tested as insufficient, and re-test the same representative locations, as necessary, until the soil moisture content complies with the standards as required by Subsection C of 20.11.20.16 NMAC. The respondent or the department shall use a reasonably accurate commercially-available instrument to determine soil moisture content. Where possible, methods for determining soil moisture content shall be consistent with ASTM standards (e.g. ASTM D-1556-90 - sand cone test, ASTM D2922-91 - nuclear density). All tests for soil moisture content shall be documented and retained for the duration of the permit, and shall be made available to the department upon request.

(2) Use of properly-maintained fabric fencing material around the perimeter of the disturbed surface area with openings no wider than necessary to allow vehicles to enter or exit the area. The fencing material shall be anchored approximately six inches below the surface on the bottom edge, and when installed shall be approximately 24 or more inches above the existing natural or man-made surface. The fence shall be installed in a durable manner. For example, one durable installation method involves use of steel T-posts spaced approximately eight to 10 feet apart with steel mesh wire used as a reinforcement backing to the fabric. Use of fabric fencing standards associated with the national pollutant discharge system may be approved by the department if they are consistent with the requirements of Paragraph (2) of Subsection C of 20.11.20.16 NMAC. The department may also approve alternative fencing material if it provides equal or better control of fugitive dust. Alternatives may include solid walls or sturdy fences that effectively control fugitive dust. To maintain effectiveness of the fence, fugitive dust that accumulates on either side of the fencing shall be removed promptly.

(3) Use of chemical dust suppressants applied in amounts, frequency and rates recommended by the manufacturer, and maintained as recommended by the manufacturer sufficient to substantially reduce fugitive dust leaving the fugitive dust source while active operations are idle, usually used when active operations are suspended for more than 48 hours.

(4) A department-approved alternative dust control measure or measures that provide fugitive dust control that is equal to or better than measures in Paragraphs (1) and (2), or (2) and (3) of Subsection C of 20.11.20.16 NMAC. Before a permittee may substitute an alternative control measure, the department must approve the control measure in writing as a permit amendment.

(5) Stopping active operations that are capable of producing fugitive dust.

D. Active operations during an announced high wind event: The department shall use national weather service (NWS) data, recorded at either the Albuquerque international airport (Sunport) or Double Eagle II airport, in order to determine forecasted or actual wind speeds when announcing that a high wind event may or will occur. Wind velocity measurements taken in the field by the department, the responsible person, or permittee shall be taken at a representative active operation area on the permitted property or by the department within 200 feet of the permitted property being evaluated to determine whether active operations can be continued, resumed or initiated. Wind measurement results shall be documented and retained throughout the duration of the permit, and shall be made available to the department and the permittee and/or person responsible for controlling fugitive dust at the permitted property. A continuous one-hour wind velocity measurement with an average wind speed of less than 20 miles per hour, along with on-site stable soil conditions and effective dust control measures, as stated in the fugitive dust control plan, shall be sufficient to allow active operations during an announced high wind event. However, fluctuations in average wind speed and high wind gusts may re-occur and can cause ineffective dust control during active operations, which may result in a violation of 20.11.20 NMAC. Therefore, the responsible person or permittee shall continuously assess wind conditions and on-site soil conditions during an announced high wind event and shall maintain the reasonably available control measures which include stopping active operations as required by Paragraph (5) of Subsection C of 20.11.20.16 NMAC.

E. Limitations on use of affirmative defense: A respondent may not assert the affirmative defense described in 20.11.20.16 NMAC:

(1) against an action for injunctive relief; or

(2) to prohibit the EPA or a citizen’s group from taking an enforcement action.

[20.11.20.16 NMAC - Rp, 20.11.20.16 NMAC, 9/9/2025]

20.11.20.17 FILING, REVIEW AND INSPECTION FEES: The fees required by 20.11.20 NMAC are located in 20.11.2 NMAC, Fees. The filing and review fee portion of the total permit application fee due when a fugitive dust control construction application is filed is non-refundable.

[20.11.20.17 NMAC - Rp, 20.11.20.17 NMAC, 9/9/2025]

20.11.20.18 FUGITIVE DUST CONTROL CONSTRUCTION PERMIT APPLICATION PROCESSING:

A. A person who is required to submit a fugitive dust control construction permit (permit) application and plan for active operations that will disturb at least three-quarters of an acre, but no more than 25 acres, shall submit the permit application and plan with the applicable fees to the department no fewer than 10 business days prior to the start of active operations. Within 10 business days of the department receiving the permit application, plan and fees, the department will approve the permit, approve the permit with conditions or deny the permit.

B. A person who is required to submit a permit application and plan for active operations that will disturb more than 25 acres shall submit the permit application and plan with the applicable fees to the department no fewer than 20 business days prior to the start of active operations. Within 20 business days of the department receiving the permit application, plan and fees, the department will approve the permit, approve the permit with conditions or deny the permit.

C. The fugitive dust control plan may be in any form including a copy of a program that complies with any other statute or regulation so long as the plan provides reasonably available control measures whose purpose is to mitigate fugitive dust and the plan meets the objectives of 20.11.20 NMAC. If the plan does not specifically enumerate the control measures proposed to mitigate fugitive dust, the permit application shall be deemed incomplete and shall be rejected. If an incomplete application is rejected, a new or amended application may be filed and the time limits in Subsections A or B of 20.11.20.18 NMAC shall apply as if the initial application had not been filed.

D. If all requirements of 20.11.20 NMAC have been met by the applicant, the department shall issue a permit to the permittee, which shall authorize commencement of active operations. If the department has not approved, denied, or notified the applicant regarding the permit application within 30 business days of the department's receipt of the permit application, plan and fees, then the permit shall be automatically approved and operations may commence if the permittee uses the reasonably available control measures and fugitive dust control plan as submitted in the application. However, if the measures and plan are not effective, the department may initiate an enforcement action for violation of 20.11.20 NMAC.

[20.11.20.18 NMAC - Rp, 20.11.20.18 NMAC, 9/9/2025]

20.11.20.19 PUBLIC AND PRIVATE UNPAVED ROADWAYS, SHORT-CUTS AND UNPAVED PARKING AREAS:

A. No unpaved roadway greater than one-quarter mile in length and no unpaved parking areas may be constructed or allowed to be constructed or reconstructed on any publicly-owned land or privately-owned real property, unless the owner has applied for and received a permit pursuant to 20.11.20.13 NMAC or 20.11.20.14 NMAC. Owners in possession of a valid fugitive dust control permit that wish to construct additional unpaved roadways shall apply for an amendment to their permit which shall include payment of any fees required by 20.11.2 NMAC. In addition, no unpaved short-cut of any length on private or public property may be constructed or be allowed to remain usable when it is evident the short cut is being used by motor vehicle drivers to save time by avoiding use of a dedicated and authorized roadway. A variance from Subsection A of 20.11.20.19 NMAC may be granted by the board in a manner consistent with the variance procedures provided in 20.11.7 NMAC.

B. Owners or operators shall use reasonably available control measures on all unpaved roadways and unpaved parking areas and shall comply with the general provisions established in 20.11.20.12 NMAC.

C. Public unpaved roadway; complaints. If the department receives a fugitive dust complaint regarding an unpaved public roadway, the department will forward the complaint by hand delivery, inter-office mail delivery or certified mail, return receipt requested, to the governmental agency responsible for maintenance of the roadway. Within 45 calendar days from the date the complaint was received by the responsible agency, the responsible agency shall make a reasonable effort to address the complaint, and the governmental agency shall provide the department with a written report of the actions taken to resolve the complaint. Failure of the responsible agency to submit a timely report shall be a violation of 20.11.20 NMAC.

[20.11.20.19 NMAC - Rp, 20.11.20.19 NMAC, 9/9/2025]

20.11.20.20 ABRASIVE PRESSURE BLASTING OPERATIONS: A person who performs abrasive pressure blasting operations shall employ reasonably available control measures or other effective control measures at all times to comply with 20.11.20.12 NMAC and shall substantially reduce fugitive dust emissions that are leaving the property where the abrasive pressure blasting operations are taking place. A person who is conducting

abrasive pressure blasting operations is not required to obtain a fugitive dust control permit from the department. However, stationary source permitting regulations, such as 20.11.41 NMAC and 20.11.42 NMAC, may apply to pressure blasting operations.
[20.11.20.20 NMAC - Rp, 20.11.20.20 NMAC, 9/9/2025]

20.11.20.21 CONTROL OF GREENWASTE MATERIAL: To prevent greenwaste from becoming ground up by the abrasive action of tires, which may then be entrained into the atmosphere as particulate matter, all persons causing, directing or authorizing greenwaste to be deposited on publicly-owned real property shall promptly remove or cause the removal of the greenwaste.
[20.11.20.21 NMAC - Rp, 20.11.20.21 NMAC, 9/9/2025]

20.11.20.22 DEMOLITION AND RENOVATION ACTIVITIES; FUGITIVE DUST CONTROL CONSTRUCTION PERMIT AND ASBESTOS NOTIFICATION REQUIREMENTS: No person shall demolish any building containing over 75,000 cubic feet of space without first delivering to the department a fugitive dust control construction permit application and fugitive dust control plan with the fee required by 20.11.2 NMAC. No active operations shall commence until a department manager, supervisor, scientist, field operations officer or health specialist signs a fugitive dust control construction permit and a copy of the signed permit is available at the site of active operations. Failure to obtain a fugitive dust control construction permit prior to commencement of demolition activities as described in 20.11.20.22 NMAC shall be a violation of 20.11.20 NMAC. All demolition and renovation activities shall employ reasonably available control measures at all times, and, when removing asbestos containing materials (ACM), shall also comply with the federal standards incorporated in 20.11.64 NMAC, *Emission Standards for Hazardous Air Pollutants for Stationary Sources*. Any inspection for asbestos containing material must be conducted by an accredited inspector. A person who demolishes or renovates any commercial building, residential building containing five or more dwellings, or a residential structure that will be demolished in order to build a nonresidential structure or building shall file an asbestos notification with the department no fewer than 10 calendar days before the start of such activity. Written asbestos notification certifying to the presence of ACM is required even if regulated ACM is not or may not be present in such buildings or structures. Failure to provide proper asbestos notification shall be a violation of the requirements of 20.11.64 NMAC. Knowingly violating provisions of 20.11.64 NMAC is a fourth-degree felony pursuant to the New Mexico Air Quality Control Act, 74-2-14.C.3 NMSA 1978.
[20.11.20.22 NMAC - Rp, 20.11.20.22 NMAC, 9/9/2025]

20.11.20.23 REASONABLY AVAILABLE CONTROL MEASURES FOR FUGITIVE DUST: The permittee may include in the permit application one or more of the reasonably available control measures included in 20.11.20.23 NMAC or one or more alternative fugitive dust control measures, including measures taken to comply with any other statute or regulation if the measures will effectively control fugitive dust during active operations or on inactive disturbed surface areas. At minimum, all projects requiring a fugitive dust control construction permit shall utilize paved or gravel entry/exit aprons, steel grates or other devices capable of removing mud and bulk material from vehicle traffic tires, and erect a properly-maintained fabric fencing material around the perimeter of the disturbed surface area with openings no wider than necessary to allow vehicles to enter or exit the area. The fencing material shall be anchored approximately six inches below the surface on the bottom edge, and when installed shall be approximately 30 or more inches above the existing natural or man-made surface. To maintain effectiveness of the entry/exit apron, steel grate or other similar device (device), accumulated materials shall be removed promptly. To maintain effectiveness of the fence, fugitive dust that accumulates on either side of the fencing shall be removed promptly.

A. Unpaved roadways:

(1) paving using recycled asphalt, routinely-maintained asphalt millings, asphaltic concrete, concrete, or petroleum products legal for such use;

(2) using dust suppressants applied in amounts, frequency and rates recommended by the manufacturer and maintained as recommended by the manufacturer;

(3) using wet suppression; or

(4) using traffic controls, including decreased speed limits with appropriate enforcement; other traffic calming methods, vehicle access restrictions and controls; road closures or barricades; and off-road vehicle access controls and closures.

B. Paved roadways:

(1) cleaning up spillage and track out as necessary to prevent pulverized particulates from being entrained into the atmosphere;

(2) using on-site wheel washes; or

(3) performing regularly scheduled vacuum street cleaning or wet sweeping with a sweeper certified by the manufacturer to be efficient at removing particulate matter having an aerodynamic diameter of less than 10 microns (i.e. PM_{10}).

C. Trucks hauling bulk materials on public and private roadways:

(1) using properly secured tarps or cargo covering that covers the entire surface area of the load;

(2) preventing leakage from the truck bed, sideboards, tailgate, or bottom dump gate;

(3) using wet suppression to increase moisture content of the bulk materials being hauled;

(4) using dust suppressants applied in amounts, frequency and rates recommended by the manufacturer; or

(5) maintaining a minimum of six inches of freeboard from the rim of the truck bed; freeboard means the vertical distance from the highest portion of the load abutting the bed and the lowest part of the top rim of the truck bed.

D. Active operations in construction areas and other surface disturbances:

(1) Short term control measures may include:

(a) wet suppression;

(b) dust suppressants applied in amounts, frequency and rates recommended by the manufacturer and maintained as recommended by the manufacturer;

(c) watering the site at the end of each workday sufficiently to stabilize the work area;

(d) applying dust suppressants in amounts, frequency and rates recommended by the manufacturer on the worksite at the end of each workweek if no active operations are going to take place over the weekend or if active operations stop for more than two consecutive days;

(e) starting construction at the location that is upwind from the prevailing wind direction and stabilizing disturbed areas before disturbing additional areas;

(f) stopping active operations during high wind; or

(g) clean up and removal of track-out material.

(2) Long term control measures may include:

(a) site stabilization using dust suppressants applied in amounts, frequency and rates recommended by the manufacturer and maintained as recommended by the manufacturer;

(b) reseeding using native grasses as specified in 20.11.20.24 NMAC;

(c) xeriscaping;

(d) installing parallel rows of fabric fencing or other windbreaks set perpendicular to the prevailing wind direction either onsite or on a nearby property with the permission of the nearby property owner;

(e) surfacing with gravel or other mulch material with a size and density sufficient to prevent surface material from becoming airborne;

(f) mulching and crimping of straw or hay as specified in Subsection D of 20.11.20.24 NMAC;

(g) installing permanent perimeter and interior walls;

(h) using conventional landscaping techniques; or

(i) clean up and removal of track-out material.

E. Bulk material handling:

(1) using spray bars;

(2) applying wetting agents (surfactants) to bulk material;

(3) using wet suppression through manual or mechanical application;

(4) adding dust suppressants to bulk materials in amounts, frequency and rates recommended by the manufacturer and maintained as recommended by the manufacturer;

(5) stopping bulk material handling, processing, loading or unloading during high wind conditions;

(6) reducing process speeds; or

(7) reducing drop heights.

F. Industrial sites:

(1) paving roadways and parking area with recycled asphalt, asphaltic concrete, concrete, or petroleum products legal for use;

(2) performing regularly scheduled vacuum street cleaning or wet sweeping;

(3) regularly using wet suppression on unpaved areas;

(4) using dust suppressants applied in amounts, frequency and rates recommended by the manufacturer, and maintained as recommended by the manufacturer;

(5) installing wind breaks;

(6) installing enclosures;

(7) installing on-site anemometers to measure wind speed; the anemometer should trigger a suitable warning mechanism such as a strobe light or an audible alarm (that will not violate any applicable noise ordinance) to notify on-site personnel of high wind conditions;

(8) increasing wet suppression applications before and during high wind conditions; or

(9) stopping active operations during high wind conditions.

G. Demolition and renovation activities when asbestos-containing materials are not present:

(1) using constant wet suppression on the debris piles during demolition;

(2) using water or dust suppressants on the debris pile, applied in amounts, frequency and rates recommended by the manufacturer;

(3) using enclosures;

(4) using curtains or shrouds;

(5) using negative pressure dust collectors; or

(6) stopping demolition during high wind conditions.

H. Milling, grinding or cutting of paved or concrete surfaces:

(1) constantly using wet suppression;

(2) continuous wet sweeping during milling, grinding, or cutting operations;

(3) using dust suppressants applied in amounts, frequency and rates recommended by the manufacturer, and maintained as recommended by the manufacturer;

(4) using enclosures; or

(5) using curtains or shrouds.

I. Pressure blasting operations:

(1) using non-friable abrasive material;

(2) using curtains, enclosures or shrouds;

(3) using negative pressure dust collectors;

(4) using constant wet suppression;

(5) maintaining ongoing clean up of abrasive material; or

(6) stopping active operations during high wind conditions.

J. Spray painting and other coatings:

(1) using enclosures that comply with applicable fire codes; or

(2) using curtains, enclosures or shrouds.

K. High wind contingency measures:

(1) installing and using on-site anemometers to measure wind speed; the anemometer should trigger a suitable warning mechanism such as a strobe light or an audible alarm that will not violate any applicable noise ordinance to notify on-site personnel of high wind conditions;

(2) using constant wet suppression;

(3) using dust suppressants applied in amounts, frequency and rates recommended by the manufacturer;

(4) using wetting agents or surfactants on disturbed areas, bulk materials or stockpiles;

(5) slowing down process; or

(6) shutting down active operations.

L. Stockpile Formation:

(1) Active stockpiles:

(a) applying wet suppression on a regular basis;

(b) utilizing wind breaks (fabric fencing or other materials);

(c) reducing vehicle speeds or using other traffic calming measures (e.g. sculpted piles); or

(d) restricting access to stockpile areas during non-work hours.

(2) Inactive stockpiles:

(a) maintaining a stable outer crust over stockpile area;

(b) using dust suppressants applied in amounts, frequency and rates recommended by the manufacturer, and maintained as recommended by manufacturer;

(c) restricting access to stockpile areas; or

(d) utilizing wind breaks (fabric fencing or other materials).

[20.11.20.23 NMAC - Rp, 20.11.20.23 NMAC, 9/9/2025]

20.11.20.24 NATIVE GRASS SEEDING AND MULCH SPECIFICATIONS:

A. If the fugitive dust control permit includes provisions to revegetate a disturbed area, the permittee may use the specifications described in 20.11.20.24 NMAC. When properly applied and maintained, these specifications have provided reasonably successful results in the past in Bernalillo county. They are included here as a reference for permittees and others who choose to use native revegetation as a long-term reasonably available control measure. However, use of these specifications does not guarantee success. Failure of any revegetation method as a long-term reasonably available control measure requires re-application or other control method approved by the department. The disturbed area shall maintain compliance with 20.11.20 NMAC.

(1) The native seed species used and rate of application should be as provided in Subsection F of 20.11.20.24 NMAC.

(a) If the area to be seeded is along a recreational trail of any type, the seed mixes for either type of soil listed in Subsection F of 20.11.20.24 NMAC should not include four-wing saltbush and the seeding rate should be reduced by one pound per acre.

(b) Seeds may be pre-mixed by a seed dealer. Each pre-mixed bag of seed should be sealed and labeled by the seed dealer in accordance with federal seed laws and New Mexico department of agriculture labeling laws. The label should include: variety, kind of seed, lot number, purity, germination, percent crop, percent inert, percent weed (including noxious weeds), origin, test data and net weight. Federal seed laws require that analysis shall be no older than five months for seed shipped interstate and no older than nine months for seed shipped intra-state.

(c) 48 hours before seeding, the owner or operator should give written notice to the department by hand delivery or facsimile, requesting inspection of the sealed seed bags to be used. The department may inspect the sealed seed bags and labels.

(2) Fertilizer and soil amendments: unless otherwise specified in the fugitive dust control permit, no fertilizer or other soil amendments are required on areas to be reseeded.

(3) Mulch: areas to be reseeded should be mulched as described below unless otherwise specified in the permit.

(a) Hay mulch: perennial native or introduced grasses of fine-stemmed varieties should be used unless otherwise specified in the plan. At least 65 percent of the herbage by weight of each bale of hay should be 10 inches in length or longer. Hay with noxious seed or plants should not be used. Rotted, brittle, or moldy hay are not considered acceptable. Marsh grass or prairie hay composed of native grass of species to be seeded is considered acceptable. Tall wheat grass, intermediate wheat grass, switch grass, or orchard hay will be acceptable if cut prior to seed formation. Marsh grass hay should be composed of mid and tall native, usually tough and wiry grass and grass-like plants found in the lowland areas within the Rocky Mountain region. Hay should be properly cured prior to use. Hay that is brittle, short fibered or improperly cured is not considered acceptable. Hay mulch should be crosshatched crimped to minimum depth of two inches.

(b) Straw mulch: small grain plants such as wheat, barley, rye, or oats should not be used. Alfalfa or the stalks of corn, maize or sorghum are not considered acceptable. Material which is brittle, shorter than 10 inches or which breaks or fragments during the crimping operation are not considered acceptable. Straw mulch should be crosshatched crimped to minimum depth of two inches.

(c) Gravel mulch: gravel mulch should be a maximum of three-quarter to one inch in diameter and must have been crushed or screened with a minimum of one angular face. Experience has demonstrated that gravel mulch provides very successful results on steep slopes and other areas that may be difficult to stabilize.

(d) Erosion control mats, fabric or blankets: the type of erosion control mats, fabric or blankets used should be specified in the fugitive dust control permit.

B. Seed bed preparation:

(1) Prior to starting seed bed preparation, the final grades of all earthwork should be inspected and certified by a New Mexico licensed engineer, and a copy of the certification should be delivered to the department:

(a) no soil preparation should be performed when the surface is wet or muddy or when the soil is so moist that the soil is not fully loosened by the discing operation;

(b) if erosion, crusting or re-compaction occurs in an area before seeding, mulching and crimping are successfully completed, the area should be reworked, beginning with seedbed preparation.

(2) Mechanical preparation: the seedbed should be loosened to a minimum depth of six inches by disc or harrow. Areas of heavy or compacted soil may require additional preparation by chiseling or ripping if discing alone does not result in preparation to the full minimum depth of six inches. The soil should be worked to a smooth surface and should be free of clods, stones four inches in diameter and larger, and debris or foreign material that could interfere with seeding or crimping operations.

(3) Hand preparation: areas which cannot be prepared with mechanized equipment because of small size, irregular shape or slope may be prepared to a minimum depth of two inches using hand tools or a rototiller, as specified in the permit.

C. Seeding:

(1) Should not start until the seed bed preparation has been inspected and certified by a New Mexico licensed engineer, a New Mexico licensed landscape architect, or other professional approved by the department (e.g. a department certified erosion control specialist). Notice in writing or by facsimile providing certification pertaining to the seed bed preparation should be given to the department at least 48 hours prior to beginning seeding operations so that the department has an opportunity to inspect the site. No seeding operations should be conducted when steady wind speeds exceed 10 miles per hour.

(2) Seed application:

(a) Drill seeding: drill seeding is highly recommended. Seed should be applied with a "rangeland" type seed drill equipped with packer wheels. Seed should be drilled to a maximum depth of one-half inch. Direction of seeding should be across slopes and on the contour whenever possible.

(b) Broadcast seeding: seed may be applied using the broadcast method when size, irregular shape, or slope exceeding three to one, prevents the use of a seed drill. Seed may be broadcast by hand or by a mechanical seeder provided that the seed is evenly distributed over the seeding area. Areas that are broadcast seeded should be seeded at a rate that is double the rate used for drill seeding. Areas of broadcast seeding should be hand raked to cover seed.

(c) Seeding with gravel mulch: areas to be gravel mulched should be seeded at double the standard seed rate with one-half the seed applied prior to application of gravel and one-half of the seed applied on the surface of the gravel. Water should be applied in a quantity sufficient to wash seed from the surface and into the gravel.

(d) Hydro seeding: hydro seeding with native grass will normally only be successful on areas that will be irrigated.

D. Hay or straw mulching:

(1) All seeded areas should be mulched unless otherwise specified in the fugitive dust control permit. On seeded areas that are level or have slopes that are a ratio of three to one or less, any of the four types of mulching below may be used. On erosion control areas or slopes steeper than a ratio of three to one, only gravel mulch or erosion control materials should be used.

(2) Hay mulch should be applied at a minimum rate of one and one-half tons per acre of air dry hay.

(3) Straw mulch should be applied at a minimum rate of two and one-half tons per acre of air dry straw.

(4) Hay or straw mulch should be crosshatched crimped into the soil to a minimum depth of two inches.

(a) The mulch should be spread uniformly over the area either by hand or with a mechanical mulch spreader.

(b) When spread by hand, the bales of mulch should be torn apart and fluffed before spreading.

(c) Mulching should stop when wind speeds exceed 15 miles per hour.

(d) The mulch should be wetted down and allowed to soften for approximately 15 to 20 minutes prior to crimping.

(e) A heavy disc should be used to crimp or anchor the mulch into the soil to a minimum depth of two inches. A mulch-tiller with flat serrated discs at least one-quarter of an inch in thickness, having dull edges with discs spaced six inches to eight inches apart or similar equipment should be used. The discs should be of sufficient diameter to prevent the frame of the equipment from dragging the mulch.

(f) The crimping operations should be across the slope where practical, but not parallel to prevailing winds. In general, crimping should be in a north-south direction or in tight interlocking "S" curves to avoid straight east-west crimp lines.

(g) If small grain straw mulch is used, the mulch should be crimped in two directions in a cross-hatch pattern.

(5) Gravel mulch: gravel mulch should be laid evenly by hand or by equipment to a thickness of two inches.

(6) Erosion control mats, fabric or blankets: the type of erosion control mats, fabric or blankets used should be as specified in the fugitive dust control permit. Anchoring of the erosion control materials should be consistent with the manufacturer's recommendations.

(7) Upon completion of the reseeding project, the permittee should deliver written notice to the department in a timely manner, certifying completion of seeding project.

E. Protection of native grass seeded area: the person, owner or operator who has elected to use native seeding as a control measure shall be responsible for protecting and caring for the seeded area until plants are fully established. After project completion, the owner or operator shall repair any damage to seeded areas caused by pedestrian or vehicular traffic or vandalism. During periods of low rainfall, supplemental watering may be required to successfully establish the native grass seed. Because the owner is responsible for the fugitive emissions leaving the property, failure of the reseeding project shall not be a defense to enforcement of 20.11.20 NMAC. The owner or operator may find it necessary to reseed or use other reasonably available control measures to bring the property into compliance. The department strongly recommends that any area being seeded or mulched be adequately fenced and posted to prevent trespass traffic.

F. Seed specifications and rates should be used as established by the most recent edition of "*city of Albuquerque standard specifications for public works construction - native grass seeding"* section as updated by the city or as approved in writing by the department.

G. Variations in seeding due to special environmental conditions: the owner or operator may use a different seeding mixture in order to address special environmental conditions that make it unlikely for success of the reseeding effort. Use of an annual rye (*Lolium sp*.) or cool season grasses (e.g. barley at 10 pounds per acre) may be added to the seed specification in order to help stabilize soils, especially for disturbed areas comprising 25 acres or more when a significant amount of the publicly-owned land or privately-owned real property is not expected to be built upon within one year.

[20.11.20.24 NMAC - Rp, 20.11.20.24 NMAC, 9/9/2025]

20.11.20.25 REVIEW MEETING: TIMELY PETITION FOR HEARING BEFORE THE BOARD: If a permit applicant or permittee (requestor) asks the department to meet informally to review and reconsider the department's decision regarding the applicant's permit application in the manner provided by 20.11.20.25 NMAC, the process shall not extend the 30-day deadline for filling a timely petition for a hearing before the board as provided by 20.11.81 NMAC. If a requestor is adversely affected by, or disagrees with the department's decision regarding the requestor's permit application, the requestor may request an informal review meeting to discuss the department's decision. The request shall be in writing or on a form provided by the department. Within five business days after the requestor receives the department's decision regarding the permit application, the requestor shall deliver the written request to a division manager. Within five business days after a division manager receives the request, a division manager or designee shall hold an informal review meeting with the requestor and an additional division representative (e.g. the person assigned to the permit application review) in an attempt to resolve disagreements. Within two business days after the informal review meeting, a division representative shall mail, hand deliver or deliver by facsimile a statement to the requestor stating whether the department has changed its decision regarding the permit application, and, if so, specifying the change and the reason for the change. A person who participated in a 20.11.20 NMAC permitting action before the department and who is adversely affected by the decision made by the department, may follow the procedures described in 20.11.81 NMAC to petition for a hearing before the board.

[20.11.20.25 NMAC - Rp, 20.11.20.25 NMAC, 9/9/2025]

20.11.20.26 VISUAL DETERMINATION OF FUGITIVE DUST EMISSIONS: The following method, hereafter called the "visible fugitive dust detection method", is used to visually determine the total amount of time that fugitive dust emissions are visible during a continuous one-hour observation period. If a trained department observer records visible fugitive dust crossing a property line of the property being investigated, for a total of 15 minutes or more during a continuous one-hour period, a violation of 20.11.20 NMAC has occurred. The observer

does not have to be certified in procedures found in 40 CFR 60, Method 9, *Visual Determination of the Opacity of Emissions from Stationary Sources* (EPA Method 9). However, the observer shall receive training regarding how to identify a violation of 20.11.20 NMAC that is caused by anthropogenic activities and to distinguish fugitive dust that emanates from a source that is not required by a board regulation other than 20.11.20 NMAC to obtain a permit. Training shall consist of attendance at and completion of the lecture portion of a Method 9 certification course and familiarity with the written materials provided during the course. The method described in Subsections A through D of 20.11.20.26 NMAC does not require the opacity of emissions to be determined during the observation period.

A. To correctly perform this method, the observer shall use two stopwatches. One stopwatch shall be used to record the continuous one-hour time period during which the observation is conducted. This period shall be known as the "observation period." The second stopwatch shall be used to record the total accumulated amount of time that visible fugitive dust is crossing a property line during the observation period. The second stopwatch shall establish the "visible fugitive dust emission time".

B. Prior to the observation, the observer shall:

(1) determine the location of potential fugitive dust source(s) and the location of the downwind property line for the source;

(2) sketch the location of the fugitive dust source(s), and, when available during the observation, record the observer's location on a copy of the fugitive dust control permit map or aerial photograph;

(3) sketch or photograph the location of the downwind property line and physical features that help define the property line;

(4) sketch or photograph the observer's location during the observations;

(5) sketch the position of the sun relative to the observer;

(6) document that the visible fugitive dust is not originating from an upwind source other than the source being evaluated; and

(7) maintain a minimum distance of at least 15 feet from the visible fugitive dust being observed, and a maximum distance of no more than one-quarter mile away.

C. The observer shall record:

(1) observer's name and affiliation;

(2) date of observation;

(3) company name, property owner or operators, if known;

(4) description of the fugitive dust sources;

(5) wind speed and direction (explain method of determining the wind speed, i.e., hand-held anemometer); and

(6) sky conditions.

D. The observer shall record the time of day when the observation begins. The observer shall start the first stopwatch to begin recording the observation period and shall observe along the property line. With the second stopwatch, the observer shall record the length of time visible fugitive dust is crossing the property line. The observer shall stop the second stopwatch when the visible fugitive dust is no longer detected crossing the property line. The observer shall continue this procedure during the continuous one-hour observation period or until the visible fugitive dust emission time totals 15 minutes or greater during the continuous one-hour observation period, which is a violation of 20.11.20 NMAC. The observer shall record the time of day when the observation ends. If the observer determines that the visible fugitive dust being observed is of an intensity that may cause immediate danger to human health or safety, then, before the observation period is completed, the observer shall attempt to immediately contact the responsible person, permittee or owner.

[20.11.20.26 NMAC - Rp, 20.11.20.26 NMAC, 9/9/2025]

20.11.20.27 ENFORCEMENT:

A. All persons shall use control measures that are effective in maintaining compliance with 20.11.20 NMAC. Violation of a fugitive dust control permit or fugitive dust control plan approved by the department is a violation of 20.11.20 NMAC. If a violation occurs or is occurring, the department may issue a verbal warning, issue a written warning, initiate an administrative enforcement action and assess an administrative civil penalty, and take all other actions authorized by law and equity, including issuing a stop work order as authorized by 20.11.20.27 NMAC.

B. If the department determines a person has violated or is violating a requirement or prohibition of 20.11.20 NMAC, the department may initiate an administrative enforcement action and assess an administrative civil penalty for a past or current violation, or both, as authorized by 74-2-12.A.(1) NMSA. As also authorized by 74-2-12.A.(2) NMSA and 74-2-12.1 NMSA, the department may commence a civil action in New Mexico district

court for appropriate relief, including a temporary or permanent injunction. In addition, as authorized by 74-2-14 NMSA, the department also may commence or cause a criminal action to be commenced.

C. As authorized by 74-2-12.H NMSA, in connection with an administrative enforcement action, the director may issue subpoenas for attendance and testimony of witnesses and the production of relevant papers, books and documents and may adopt rules for discovery procedures.

D. If a person (requestor) asks the department for an informal review meeting to consider the department's decision regarding an administrative compliance order in the manner provided by 20.11.20.27 NMAC, the process shall not extend the 30-day deadline for submitting a written request to the department director requesting a public hearing as provided by 74-2-12.C NMSA. If a person receives an administrative compliance order from the department, that person ("requestor") may request an informal review meeting to discuss the administrative compliance order. The request shall be in writing or on a form provided by the department. The requestor shall deliver the written request for an informal review meeting to the director and a division manager within five business days after the requestor has received the administrative compliance order. Within five business days of receiving the request, a division manager or designee shall hold an informal review meeting with the requestor and a division representative (e.g. division manager, compliance officer, or person issuing the order) in an attempt to resolve the administrative compliance order. Within two business days after the informal review meeting, a division representative shall mail, hand deliver or deliver by facsimile a statement to the requestor with the department's final decision regarding the administrative compliance order and the reasons for the decision. If the requestor is adversely affected by the final decision made by the department, the requestor may follow the procedures described in Subsection E of 20.11.20.27 NMAC.

E. A person who receives an administrative compliance order and chooses not to sign the compliance order or similar document as requested by the department, and comply with its terms, may request a hearing consistent with 74-2-12.C NMSA. The decision following the hearing may be appealed consistent with 74-2-9.A NMSA.

F. Payment of an administrative civil penalty shall not prevent the department from taking additional enforcement actions, if the violation is repeated or an additional violation occurs. Payment of an administrative civil penalty for a prior or additional violation shall not be a defense to a subsequent action taken by the department to resolve an additional violation. Actions by the department may include suspension or revocation of a permit, as provided by 74-2-12.B NMSA, and issuance of a stop work order.

G. The permittee or responsible person as identified in the permit shall take all actions required by the permit to prevent a violation of 20.11.20 NMAC, including stopping active operations, if necessary. If the permittee or responsible person as identified in the permit fails to take all required actions, the owner or operator, if different, shall take all actions required to prevent or satisfactorily resolve a violation of 20.11.20 NMAC, including stopping active operations, if necessary.

H. The department may issue a stop work order, which shall suspend all active operations except for the required application of reasonably available control measures. The department also may revoke a permit issued by the department if the permittee fails to implement the reasonably available control measures required by the fugitive dust control permit.

I. If a person fails to obtain a permit as required by 20.11.20 NMAC, the department may issue a stop work order which shall require all active operations at a site to stop except for application of reasonably available control measures.

J. The stop work order, which shall be effective 24 hours after the person, permittee, owner, operator, or responsible person named in a permit receives the stop work order, unless an earlier deadline for stopping work or other activities is imposed by the department for good reason. The stop work order shall remain in effect until the person, permittee, owner, operator, or responsible person named in the permit demonstrates to the satisfaction of the department that the activities of the person, permittee, owner, operator or responsible person named in the permit comply with the provisions of 20.11.20 NMAC.

[20.11.20.27 NMAC - Rp, 20.11.20.27 NMAC, 9/9/2025]

20.11.20.28 PUBLIC OUTREACH AND TRAINING:

A. The department shall provide or approve public education regarding reducing fugitive dust. The department shall maintain an electronic information system using the Internet in order to provide access to the general public and regulated business community regarding fugitive dust control programs, activities, regulations, regulatory requirements, forms and information.

B. The department shall implement a program to provide training at no cost to individuals who are or may be required to comply with provisions of 20.11.20 NMAC. Approximately twice per year, the department shall

provide or approve training workshops on fugitive dust and its control to persons who conduct or participate in projects involving active operations and to other interested persons. When a person attends the training and successfully passes a test, the department or approved trainer shall issue a certificate stating that the person has successfully completed the training.
[20.11.20.28 NMAC - Rp, 20.11.20.28 NMAC, 9/9/2025]

20.11.20.29 COMPLAINTS: The department shall respond to complaints from residents, businesses and others in a timely manner, but in no case shall the initial response take longer than three business days.
[20.11.20.29 NMAC - Rp, 20.11.20.29 NMAC, 9/9/2025]

HISTORY OF 20.11.20 NMAC:
Pre-NMAC History: The material in this part was derived from that previously filed with the commission of public records - state records center and archives.
Regulation No. 8, Airborne Particulate Matter, filed 3/24/82.
Regulation No. 8, Airborne Particulate Matter, filed 2/17/83.

Other History: Regulation No. 8, Airborne Particulate Matter (filed 2/17/83) was renumbered and reformatted into first version of the New Mexico Administrative Code as 20 NMAC 11.20, Airborne Particulate Matter, effective 12/01/95.
20 NMAC 11.20, Airborne Particulate Matter (filed 10/27/95) replaced by 20 NMAC 11.20, Airborne Particulate Matter, effective 07/01/96.
20 NMAC 11.20, Airborne Particulate Matter (filed 5/29/96) renumbered, reformatted and replaced by 20.11.20 NMAC, Fugitive Dust Control, effective 3/1/04.

History of Repealed Material:
20 NMAC 11.20, Airborne Particulate Matter (filed 5/29/96); repealed 3/1/04.
20.11.20 NMAC, Fugitive Dust Control (filed 1/28/04) repealed 3/17/08.
20.11.20 NMAC, Fugitive Dust Control (filed 1/28/04) replaced by 20.11.20 NMAC, Fugitive Dust Control, effective 3/17/2008.
20.11.20 NMAC Fugitive Dust Control, filed 3/17/2008, was repealed and replaced by 20.11.20 NMAC Fugitive Dust Control, effective 9/9/2025.

Appendix C

Confirmation Letter from EPA for Fugitive Dust Mitigation Plan

REGION 6 ADMINISTRATOR

DALLAS, TX 75270

July 9, 2024

Mr. Angel Martinez, Director
City of Albuquerque, Environmental Health Department
P.O. Box 1293
Albuquerque, NM 87102

Dear Director Martinez:

Thank you for the City of Albuquerque Environmental Health Department's (EHD's) submittal of the Albuquerque-Bernalillo County *High Wind Fugitive Dust Mitigation Plan* (DMP) through the Environmental Protection Agency's (EPA's) State Planning Electronic Collaboration System (SPeCS) on April 26, 2024. EPA notified EHD by letter on April 27, 2022, that the Agency determined Bernalillo County, New Mexico to have frequently recurring exceptional events related to windblown dust, making the area subject to the mitigation plan requirements found in the EPA's 2016 Exceptional Events Rule (EER) and codified at 40 CFR parts 50.1, 50.14 and 51.930. We appreciate your timely submittal of this important plan pursuant to the EER and the EPA's April 2019 *Guidance on the Preparation of Demonstrations in Support of Requests to Exclude Ambient Air Quality Data Influenced by High Wind Dust Events Under the 2016 Exceptional Events Rule.*

We have reviewed the DMP and find that it is consistent with the basic plan components identified within 40 CFR 51.930 and the EPA's April 2019 guidance. The basis for EPA's review is set forth in the enclosed document. We also wish to note that while the DMP is consistent with the EER and relevant guidance, the EER requires that the state must make the demonstrations as referred to in 40 CFR 50.14 to the EPA for data regarding emissions from windblown dust to be excluded from determinations of exceedances and NAAQS violations. These demonstrations must be made in addition to the implementation of a DMP for such data to be excluded from the relevant determinations.

We acknowledge and appreciate your efforts in developing the Bernalillo County DMP. We look forward to continuing our work with your agency to further improve air quality in Bernalillo County. Should you have any questions regarding our review of the DMP, please feel free to contact David F. Garcia, Air and Radiation Division Director, at (214) 665-7593, or your staff may contact Jeff Riley at (214) 665-8542.

Sincerely,

Earthea Nance, PhD, PE
Regional Administrator
EPA Region 6

Local Gap Effect

White Paper Excerpt – Local Gap Effect

A Climatology of High Wind Warning Events for Northern and Central New Mexico: 1976-2005

Introduction

Todd Shoemake NWS WFO Albuquerque- May 2010

High wind events frequently plague northern and central New Mexico due to synoptic, seasonal, and diurnal processes. These high wind events pose significant challenges to forecasters, and they can often have significant effects to life and property within New Mexico. High wind warnings are issued for northern and central New Mexico by the Albuquerque forecast office for non-convective wind events reaching standardized thresholds for speed. These thresholds are defined as winds having sustained speeds of 40 mph or greater and/or instantaneous gusts of 58 mph or higher. Thus, a thorough assessment of climatological wind data across northern and central New Mexico would benefit forecasters by providing supplemental knowledge of the synoptic regimes and frequency of high wind events.

Therefore, the first objective of this wind study will be to determine a climatology of high wind events for Albuquerque and seven additional sites across northern and central New Mexico. As this first objective is completed, any preconceived forecaster assumptions may be confirmed or refuted, ultimately aiding the overall forecast and warning decision-making processes. A few generalized hypotheses will be discussed in anticipation of results of the study, along with the methodology of both acquiring the data set as well as the statistical analyses performed to generate this climatology. Documented high wind events will then be partitioned into subsets, and will be interrogated before a classification of synoptic settings is applied in order to equip forecasters with conceptual models for recognizing such events.

Data and Methodology

Surface observations from the National Climatic Data Center were first obtained for a 30-year climatological record for the Albuquerque International Sunport, with data sets for additional sites added after preliminary analyses of the Albuquerque data. This complete data set spanned a timeframe from 1976 to 2005 and included both hourly surface observations and any special interim surface observations. More than two million total observations for Albuquerque and other sites were tallied, sorted, and parsed using *Excel*© software. As previously defined, all individual observations meeting the 40 mph (35 kt) sustained wind speed threshold and/or the instantaneous 58 mph (50 kt) gust threshold were considered for a preliminary high wind event. By definition, high wind warnings require only one observation to verify a non-convective high wind event, however rigorous quality assurance was performed to eliminate contamination of shorter duration high wind events that were induced by convection. Any preliminary event that did not contain at least three consecutive hourly observations of sustained wind speeds of at least 31 mph (including the initial observation meeting high wind criteria) was deemed as a short duration convective event, and thus was irrelevant to the study. This lower bound wind speed threshold of 31 mph for preceding and trailing observations was chosen based on the premise of another local office policy, which defines sustained wind speeds of 31 mph (27 kt) as hazardous, yet not life-threatening and thus worthy of an advisory product. In addition, reports of thunder as well as precipitation groups within

individual observations were examined to aid in determining if events were induced from nearby convection.

It should also be noted that the Automated Surface Observing System (ASOS) was commissioned at Albuquerque circa 1994, and for the purposes of this study it is assumed that no quality degradation occurred during this transition from fully manned surface observations to occasional human augmentation of the ASOS wind data.

Results are first presented for Albuquerque, and are followed by similar results for seven additional sites in northern and central New Mexico.

Albuquerque

After parsing and quality checking the complete data set, a total of 55 high wind days or events were found at Albuquerque during the 1976 to 2005 time frame. This gives a yearly distribution as depicted in Fig. A1 with less than two non-convective wind events occurring per year on the average. Further analysis of temporal distributions will be elaborated upon in following sections, but first wind direction will be investigated in order to classify additional event characteristics.

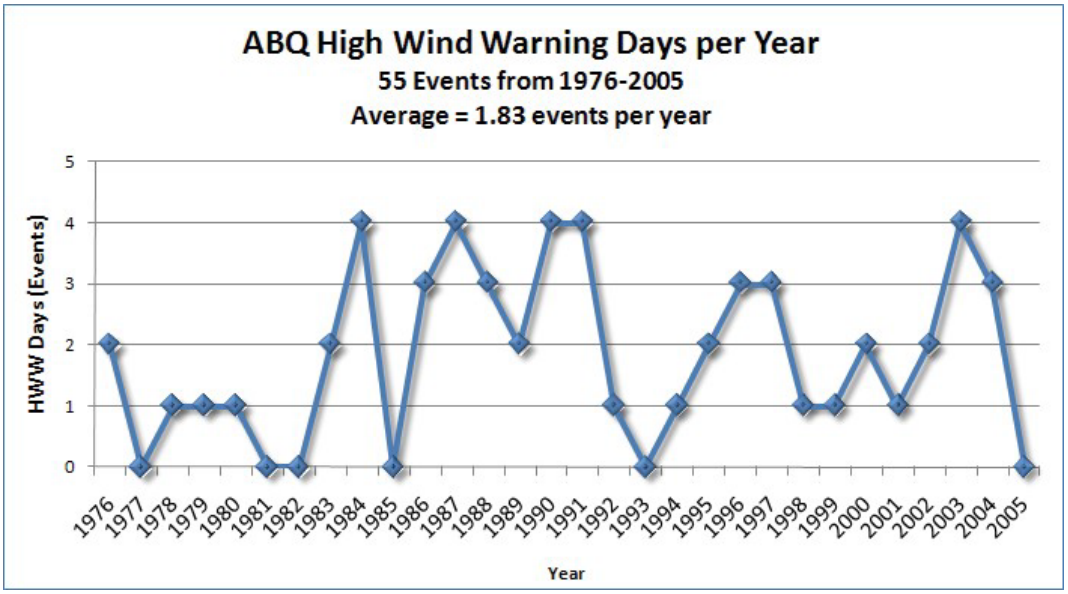

Figure A1. The frequency of high wind events at the Albuquerque Sunport from 1976 to 2005

Two Subsets for Albuquerque

An initial hypothesis was considered before analyzing the directional tendencies of high wind events at Albuquerque. Although strong east wind events are common in Albuquerque, it was hypothesized that high wind events would be predominantly from a westerly and southwesterly direction. Qualitative analysis of each of the 55 high wind days (events) quickly revealed a sharp distinction between two different types of high wind events for Albuquerque. With wind direction as the sole deterministic variable, a sharp contrast was defined between easterly high wind events versus westerly high wind events. Figure A2 depicts the partition of the frequency of high wind observations by wind direction.

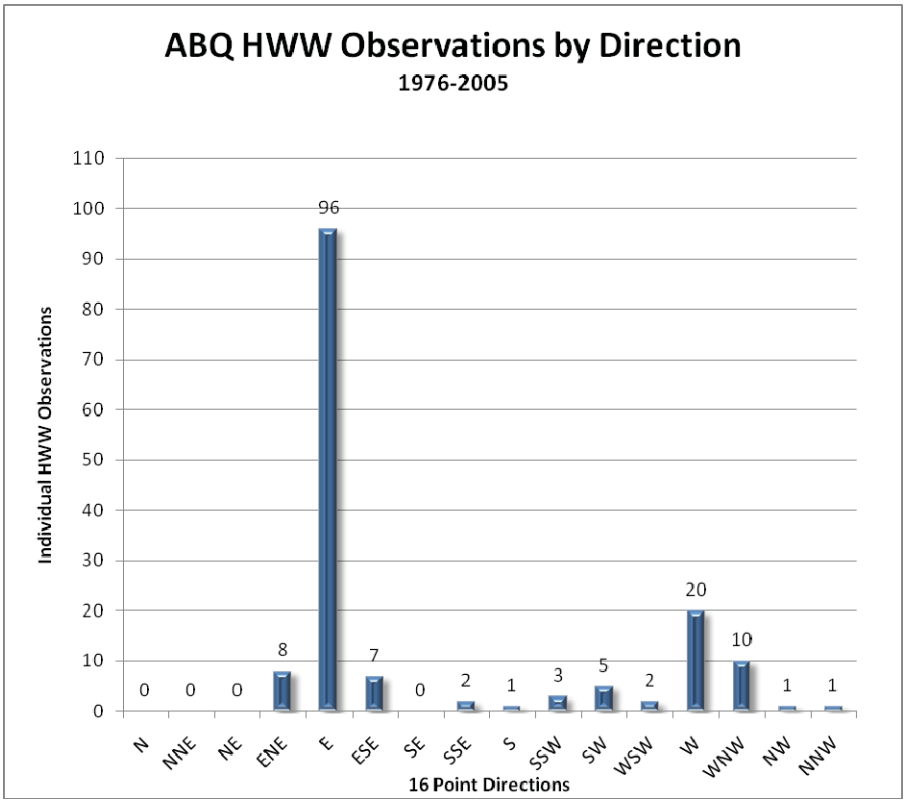

Figure A2. Frequency of high wind observations by wind direction at the Albuquerque Sunport.

Contrary to the initial hypothesis, the dominant type of high wind event was clearly the easterly event (Fig. A2). Of all the individual high wind observations, 96 (61.15%) were composed of an easterly wind direction (090º). Common forecaster knowledge from the local area associates these easterly high wind events with the local gap effect, or increased wind speeds associated with local topographical channeling from the Tijeras Canyon east of the city of Albuquerque.

Noted in Fig. A2, a second cluster is evident among events occurring with a westerly directional component. From other recurring trends known to forecasters, these westerly events are generally associated with the more dynamic weather events that affect New Mexico, most frequently in the winter and spring months as deep upper level troughs of low pressure sweep across the southwestern states. Because the two distinct maxima from both easterly events and westerly events are each artifacts of two sharply different weather mechanisms, a decision was made to divide the data into two subsets of westerly and easterly events which could then be independently analyzed. With easterly events centered about a directional mode of 090º, this first easterly subset was broadly defined by any observations hosting wind direction from an azimuthal range of 000º to 179º on the compass rose. Those deemed as westerly high wind events were centered on a directional mode of 270º, and thus were defined by observations hosting wind directions from an azimuthal range of 180º to 359º on the compass rose. After partitioning the events into two subsets, easterly events outnumbered westerly events 36 (65.45%) to 19 (34.55%).
