Appendix E: HCM Summary Reports
Appendix F: Predictive Crash Method Reports

INTRODUCTION

This report documents the Existing Traffic Analysis, Speed Limit Reduction Alternative Analysis, Single-Lane Alternative Analysis, and Conversion to Two-Way Streets Alternative Analysis for the Lead and Coal Avenues Study in Albuquerque, NM. Per the guidelines provided in the Highway Capacity Manual (HCM), delay and level of service results were obtained to assess Lead and Coal Avenues from Broadway Boulevard to Washington Street as is. The Synchro 12 analysis software was used to conduct this analysis.

STUDY ORIGINS

Residents near Lead and Coal Avenues are profoundly concerned about road safety, mainly due to frequent crashes that damage property near the roadway. These crashes often involve vehicles colliding with walls, homes, and other structures adjacent to the road, making residents perceive an unsafe environment for pedestrian or bicyclist travel. In response to these safety issues, a study was conducted in 2007 to explore how road design could improve livability in the area, which led to a corridor redesign in 2012.

Despite these changes, safety concerns persisted among residents in the years following the redesign. This prompted the Federal Highway Administration (FHWA) to conduct a road safety audit (RSA) in June 2022 with the assistance of the Mid-Region Council of Governments (MRCOG). The RSA identified 19 recommendations to enhance safety; four initiatives were advanced for further study.

In November 2022, the Lead and Coal Working Group was established to facilitate dialogue between residents, the Mayor's administration, the City of Albuquerque's Department of Municipal Development, the District 6 City Councilor, and the Albuquerque Police Department. This forum allowed residents to voice their concerns and discuss the future of the corridors with city officials, ultimately leading to the initiation of this study.

This study builds on the RSA by providing a detailed analysis of the four initiatives: Reducing the Posted Speed Limit to 25 MPH, Single-Lane operation, Two-way Operation, and a Noise Assessment. The Lead and Coal Taskforce was created to offer input and compare the study's quantitative findings with residents' qualitative experiences to enhance community involvement. The task force met with the project team biweekly to stay informed and provide feedback.

This report documents the study's findings to guide the Lead and Coal Working Group in making informed decisions about the future of these corridors.

STUDY AREA

The study area extends from Broadway Boulevard east to Washington Street along Lead Avenue and Coal Avenue in Albuquerque, New Mexico. During the scoping meeting, Lead Avenue and Coal Avenue intersections from Broadway Boulevard through Washington Street were identified for analysis.

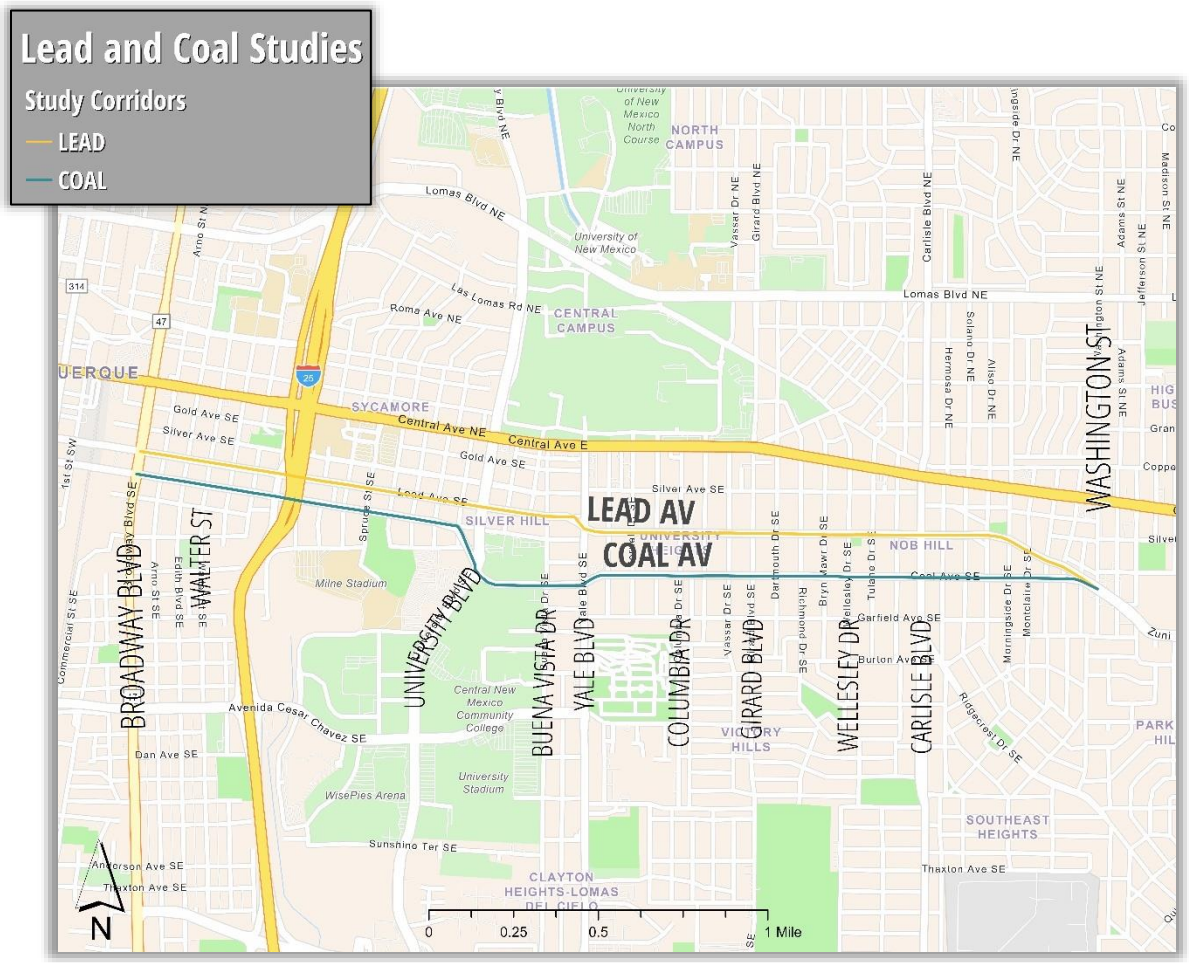

Figure 1: Study Area

DEMOGRAPHICS AND SOCIOECONOMIC PROFILE

Census tracts within one-half mile of the study corridor comprise the study area statistics. The Census Tracts comprise 5.03, 5.04, 11.01, 11.02, 12.01, 12.02, 14, 15, 17.01, 17.02, 18, 20, 21, and 49. The study area is in the southeast quadrant of Albuquerque, NM, with a population of 37,871. The median household income in the study area is $46,157, below the median income in city, county, and statewide. The percentage of the population with a disability is 17.3% within the study area, exceeding the city, county, and state. At 11.1%, the rate of households without a vehicle within the study area is greater than the city, county, and state rates, though the employment rate of 60.7% is above average.

Table 1: Selected Demographic Data - Source: 2023 American Community Survey 5-Year Estimates

	Study Area	Albuquerque	Bernalillo County	New Mexico
Population	37,871	562,488	674,357	2,114,768
Median Age	36.3	38.7	39.3	39.2
Median Household Income	$46,157	$65,604	$66,514	$62,125
Employment Rate	60.7%	60.4%	58.8%	53.5%
Hispanic or Latino	41.6%	47.9%	48.9%	48.2%
Percent of Population with a Disability	17.3%	15.2%	15.6%	16.7%
Rate of Households Without a Vehicle	11.1%	7.5%	7.0%	5.7%
Average Travel Time to Work (minutes)	18.3	22.2	22.9	23.2

Walking and bicycling may reflect one's travel preferences, but mode choice results from an individual's financial situation, city of residence, commute time and distance, and physical ability. The percentage of drivers who commute alone or carpool within the study area is significantly lower than in the city, county, and state. In contrast, the study area comprises 3.2% of people who ride bicycles and 8.4% of folks who walk. These proportions of bicyclists and pedestrians exceed the city, county, and state. The higher bicycle and pedestrian commuting rates may be due to a lower median income and a more significant proportion of households without a vehicle.

Table 2: Means of Transportation to Work - Source: 2023 American Community Survey 5-Year Estimates

Transportation Mode	Study Area	Albuquerque	Bernalillo County	New Mexico
Drove Alone	64.6%	73.2%	73.3%	75.1%
Carpooled	6.6%	8.8%	9.1%	9.6%
Public Transit	2.5%	1.3%	1.1%	0.7%
Bicycle	3.2%	0.9%	0.8%	0.5%
Walked	8.4%	1.9%	1.8%	2.0%
Other	1.2%	1.2%	1.1%	1.2%
Worked at Home	13.6%	12.8%	12.8%	11.0%

Previous and Concurrent Studies and Plans

Solutions for Albuquerque's Traffic Problems: A Comprehensive Program (1950)

A comprehensive study of Albuquerque's traffic issues was conducted in 1950 to provide recommendations ranging from signal timings to arterial street plans. The study offers recommendations for traffic ordinances, traffic engineering, arterial systems, parking, truck operations, public transit, traffic safety, zoning, and enforcement on a city-wide level.

New Vision for Lead & Coal Avenues (2007)

In 2005-06, following continued concerns regarding the impact of Lead & Coal Avenues on their neighborhoods, Wilson & Company assessed the corridor, a public involvement meeting was held, and a Stakeholder's Task Force was formed. Two recommendations were presented to city administration by the Task Force, both involving reducing the number of lanes on each roadway from three to two throughout the corridor. The options were to make Lead & Coal Avenues two-way roadways with one driving lane in each direction or one-way roadways, each with two driving lanes, and the addition of a bicycle lane.

Both recommendations were intended to reduce speeds, make the corridor more accessible to bicyclists and pedestrians, reduce accidents and traffic volumes, widen sidewalks, and meet ADA requirements. Other recommendations were also presented, including lighting, pedestrian pushbuttons, lane width restrictions, radar speed signs, red light cameras at signalized intersections, and quiet asphalt.

Road Safety Audit of Lead and Coal Avenues (Broadway Blvd. to Washington St.) (2019)

In 2019, the City of Albuquerque and a multidisciplinary team conducted a Road Safety Audit (RSA) of the Lead and Coal Avenue corridors between Broadway Boulevard and Washington Street. A total of 19 findings were graded on a scale of A through F, where the letter grades represent a priority level based on Crash Frequency and Crash Severity. The team concluded that the corridors present a variety of issues related to motorist behavior, corridor design, and infrastructure age and condition.

Lead Avenue and Coal Avenue Rest-in-Red Feasibility Study (2021)

The Lead Avenue and Coal Avenue Rest-in-Red Feasibility Study was conducted in 2021 to assess the impact and operations of a Rest-in-red scheme on Lead Avenue and Coal Avenue. Implementing Enhanced Rest-in-Red for these corridors was intended to aid with speed compliance and reduce crashes and crash severity, ultimately improving the quality of life of the residential areas on these corridors. The study recommended that Rest-in-red operations be implemented during the off-peak hours to start and adjust as needed.

City of Albuquerque 2024 Bikeway and Trail Facilities Plan (2024)

The City of Albuquerque produced a Bikeway and Trail Facilities Plan in 2024 to better manage the growth of the bikeway trail systems and ensure a safe and enjoyable experience for non-motorized users. Recommendations from this plan include bikeway facilities and crossing treatments to encourage people to choose bicycling as a mode of transportation.

Connections 2040 Metropolitan Transportation Plan (2020)

The Connections 2040 Metropolitan Transportation Plan was adopted in 2020. Its goal was to improve the efficiency of the movement of people and goods. The Mid-Region Council of Governments (MRCOG) provided a long-range plan for zoning, roadway networks, and other crucial infrastructure. It identifies gaps in the existing systems to give purpose and needs for work done in 2040.

EXISTING CONDITIONS

ROADWAY CHARACTERISTICS

Lead and Coal Avenues form a one-way couplet, with Coal running east and Lead running west. They are two-lane, one-way streets maintained by the City of Albuquerque. Between Broadway Boulevard and Washington Street, they comprise two 11-foot travel lanes; travel lanes narrow in some areas near intersections with auxiliary turn lanes. Pedestrian and bicycle facilities are present throughout the Lead and Coal corridors in the form of ADA-compliant sidewalks and bicycle lanes.

SIGNALIZED INTERSECTIONS

The following details are the traffic control and characteristics of the existing intersections in the study area:

Lead Avenue & Broadway Boulevard is a four-legged, three-way, signalized intersection. The east approach consists of a left-turn lane, two through lanes, and a right-turn lane. The north approach consists of two through lanes and a right-turn lane, while the south approach consists of a left-turn lane and two through lanes. Marked crossings, pedestrian signals, non-directional curb ramps, and detectable warning surfaces (DWS) are present at each leg of the intersection. DWS provides tactile feedback to alert pedestrians with visual impairments to curb ramps, pedestrian crossings, and transit stops. The marked crossing on the north leg of the intersection is disrupted by a median that does not appear to be used as a pedestrian refuge island.

Lead Avenue and Walter Street is a four-legged, three-way, signalized intersection. The east approach consists of two through lanes, while the north and south approaches each consist of a through lane. Marked crossings, pedestrian signals, and DWS are present at each leg of the intersection. Directional curb ramps are present on the south corners, while non-directional curb ramps are present on the north corners.

Lead Avenue Cedar Street, Buena Vista Drive, Columbia Drive, and Wellesley Drive are four-legged, three-way, signalized intersections. The east approaches consist of two through lanes, and the north and south approaches consist of a through lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at each leg of the intersection.

Lead Avenue & Morningside Drive is a four-legged, three-way, signalized intersection. The east approach consists of two through lanes, while the north and south approaches consist of a through lane. Marked crossings, pedestrian signals, and DWS are present at each leg of the intersection. Directional curb ramps are present at all crosswalks apart from the northwest corner, which is non-directional.

Lead Avenue and Locust Street is a four-legged, two-way, signalized intersection. The east approach consists of a left-turn lane and two through lanes, while the north approach consists of a through lane, a shared through/right-turn lane, and a right-turn lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at the intersection's west, north, and south legs.

Lead Avenue & Oak Street is a four-legged, two-way, signalized intersection. The east approach consists of three through lanes and a right-turn lane, while the south approach consists of a left-turn lane and two through lanes. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at the intersection's east, north, and south legs.

Lead Avenue and University Boulevard is a four-legged, three-way, signalized intersection. The east approach consists of two through lanes and a right-turn lane. The north approach consists of three through lanes, while the south approach consists of a left-turn lane and three through lanes. Marked crossings, pedestrian signals, and directional curb ramps are present at each leg of the intersection.

Lead Avenue & Yale Boulevard is a four-legged, three-way, signalized intersection. The east approach consists of a left-turn lane and two through lanes. The north approach consists of a through lane and a yield-controlled channelized right-turn lane, while the south approach consists of a left-turn lane and a through lane. Marked crossings, pedestrian signals, and DWS are present at each leg of the intersection. A pedestrian refuge island is present on the intersection's northwest corner between the through lanes and channelized right turn lane from southbound Yale Boulevard and contains a pedestrian signal. Directional curb ramps are present at all crosswalks apart from the southeast corner, which is non-directional.

Lead Avenue and Girard Boulevard are a four-legged, three-way, signalized intersection. The east approach consists of two through lanes, while the north and south approaches consist of a shared through/bicycle lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at each leg of the intersection. A bicycle lane is present along the north side of Lead Avenue.

Lead Avenue and Carlisle Boulevard are a four-legged, three-way, signalized intersection. The east approach consists of two through lanes. The north approach consists of a through lane, while the south approach consists of a left-turn lane and a through lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at each leg of the intersection.

Coal Avenue & Broadway Boulevard is a four-legged, three-way, signalized intersection. The west approach consists of a left-turn lane, two through lanes, and a right-turn lane. The north approach consists of a left-turn lane and two through lanes, while the south approach consists of two through lanes and a shared right-turn/bicycle lane. Marked crossings, pedestrian signals, and DWS are present at each leg of the intersection. Directional curb ramps are present on the north corners, while non-directional curb ramps are present on the south corners. The marked crossing on the south leg of the intersection is disrupted by a median that does not appear to be used as a pedestrian refuge island.

Coal Avenue & Walter Street is a four-legged, three-way, signalized intersection. The west approach consists of two through lanes, while the north and south approaches consist of a through lane. Marked crossings, pedestrian signals, and DWS are present at each leg of the intersection. Directional curb ramps are present on the north corners, and non-directional curb ramps are present on the south corners.

Coal Avenue & Spruce Street is a four-legged, three-way, signalized intersection. The west approach consists of two through lanes, while the north and south approaches consist of a through lane. Marked crossings, pedestrian signals, and DWS are present at each leg of the intersection. Directional curb ramps are present at all corners apart from the southeast corner.

Coal Avenue & Stanford Drive is a four-legged, three-way, signalized intersection. The west approach consists of two through lanes, while the north and south approaches consist of a through lane. Marked crossings, pedestrian signals, and directional curb ramps are present at each leg of the intersection. DWS are present at all crosswalks apart from the north side of the east leg.

Coal Avenue & Buena Vista Drive and Bryn Mawr Drive are four-legged, three-way, signalized intersections. The west approach has two through lanes, while the north and south approaches have a

through lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at each leg of the intersections.

Coal Avenue & Locust Street is a four-legged, two-way, signalized intersection. The west approach consists of three through lanes, while the north approach consists of a left-turn lane, a shared left-turn/through lane, and a through lane. Marked crossings, pedestrian signals, and DWS are present at the intersection's west, north, and south legs. Directional curb ramps are present on the southeast and northwest corners, while non-directional curb ramps are present on the southwest and northeast corners.

Coal Avenue & Oak Street is a four-legged, two-way, signalized intersection. The west approach consists of a left-turn lane and two through lanes, while the south approach consists of two through lanes and a shared through/right-turn lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at the intersection's east, north, and south legs.

Coal Avenue & University Boulevard is a four-legged, three-way, signalized intersection. The west approach consists of a left-turn lane, two through lanes, and a right-turn lane. The north approach consists of a left-turn lane and three through lanes, while the south approach consists of three through lanes and a yield-controlled channelized right-turn lane. Marked crossings and pedestrian signals are present at each leg of the intersection. Directional curb ramps are at all crosswalks apart from the northwest corner, which is non-directional. DWS are present only at the north crosswalks. A pedestrian refuge island is present on the intersection's southeast corner between the through lanes and channelized right turn lane from northbound University Boulevard and contains a pedestrian signal.

Coal Avenue & Yale Boulevard is a four-legged, three-way, signalized intersection. The west approach consists of a left-turn lane, two through lanes, and a right-turn lane. The north approach consists of a left-turn lane and a through lane, while the south approach consists of a through lane. Marked crossings, pedestrian signals, and DWS are present at each leg of the intersection. Directional curb ramps are present at all crosswalks apart from the southwest corner.

Coal Avenue and Girard Boulevard are a four-legged, three-way, signalized intersection. The west approach consists of two through lanes, while the north and south approaches consist of a shared through/bicycle lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at each leg of the intersection.

Coal Avenue and Carlisle Boulevard are a four-legged, three-way, signalized intersection. The west approach consists of two through lanes. The north approach consists of a left-turn lane and a through lane, while the south approach consists of a through lane. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at each leg of the intersection.

Coal Avenue and Morning Side Drive are a four-legged, three-way, stop-controlled intersection. The west approach has two through lanes, while the north and south approaches have through lanes. Marked crossings, pedestrian signals, directional curb ramps, and DWS are present at each leg of the intersection.

Study Area Segmentation

The project team approached the study corridor in three segments based on land use, roadway geometry, and volume. The segments are shown in Figure 2,

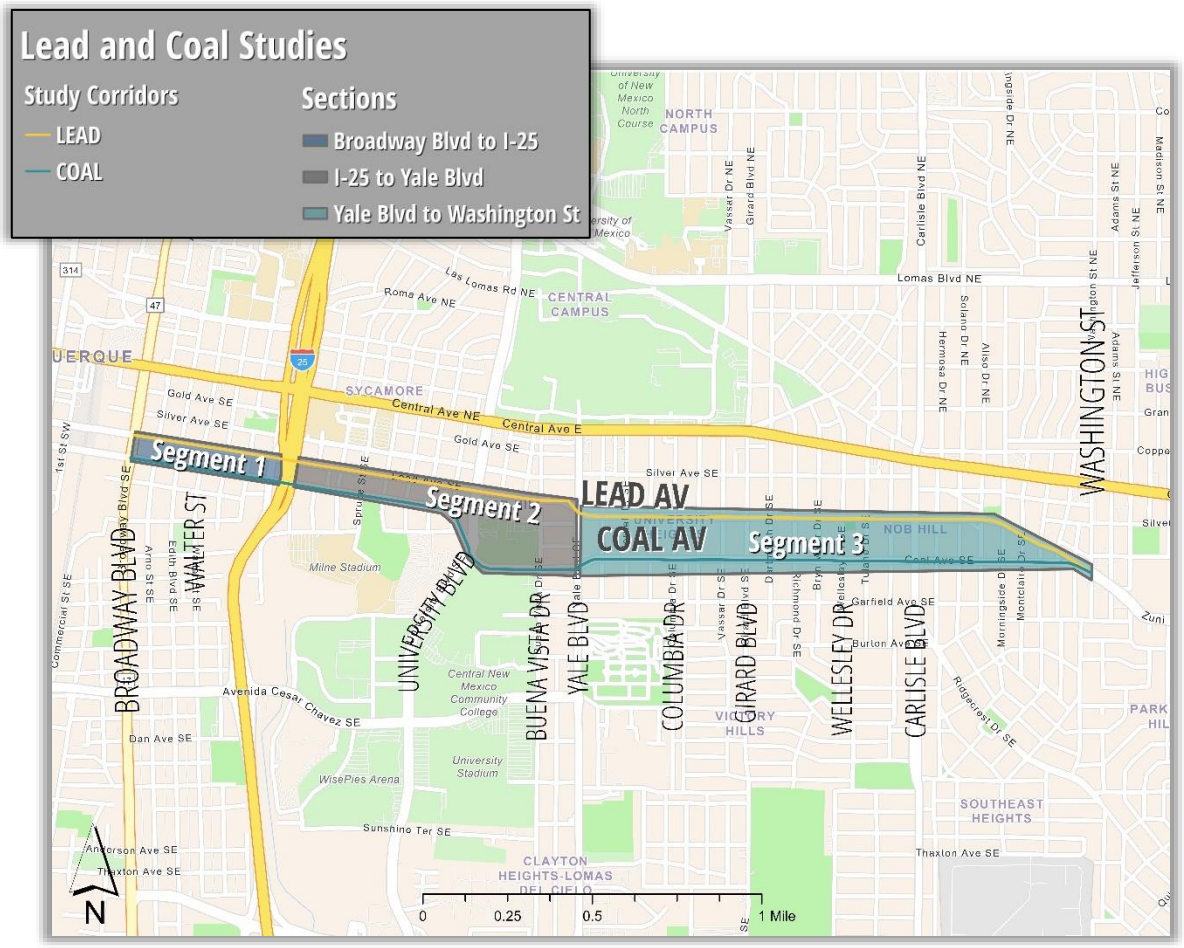

Figure 2: Study Area Segmentation

LAND USE

The study area comprises a few prominent land uses. Segment 1 abuts Low-Density Residential, Commercial Retail and Services, Multi-family, and Office primarily. Segment 2 also abuts mostly Low-Density Residential, Office, Commercial Services, Multi-family, and Educational. Segment 3 is primarily adjacent to Low-density Residential areas with some Commercial Retail, Multi-family, Commercial Services, and Offices. Figure 3 shows the adjacent land of the study area.

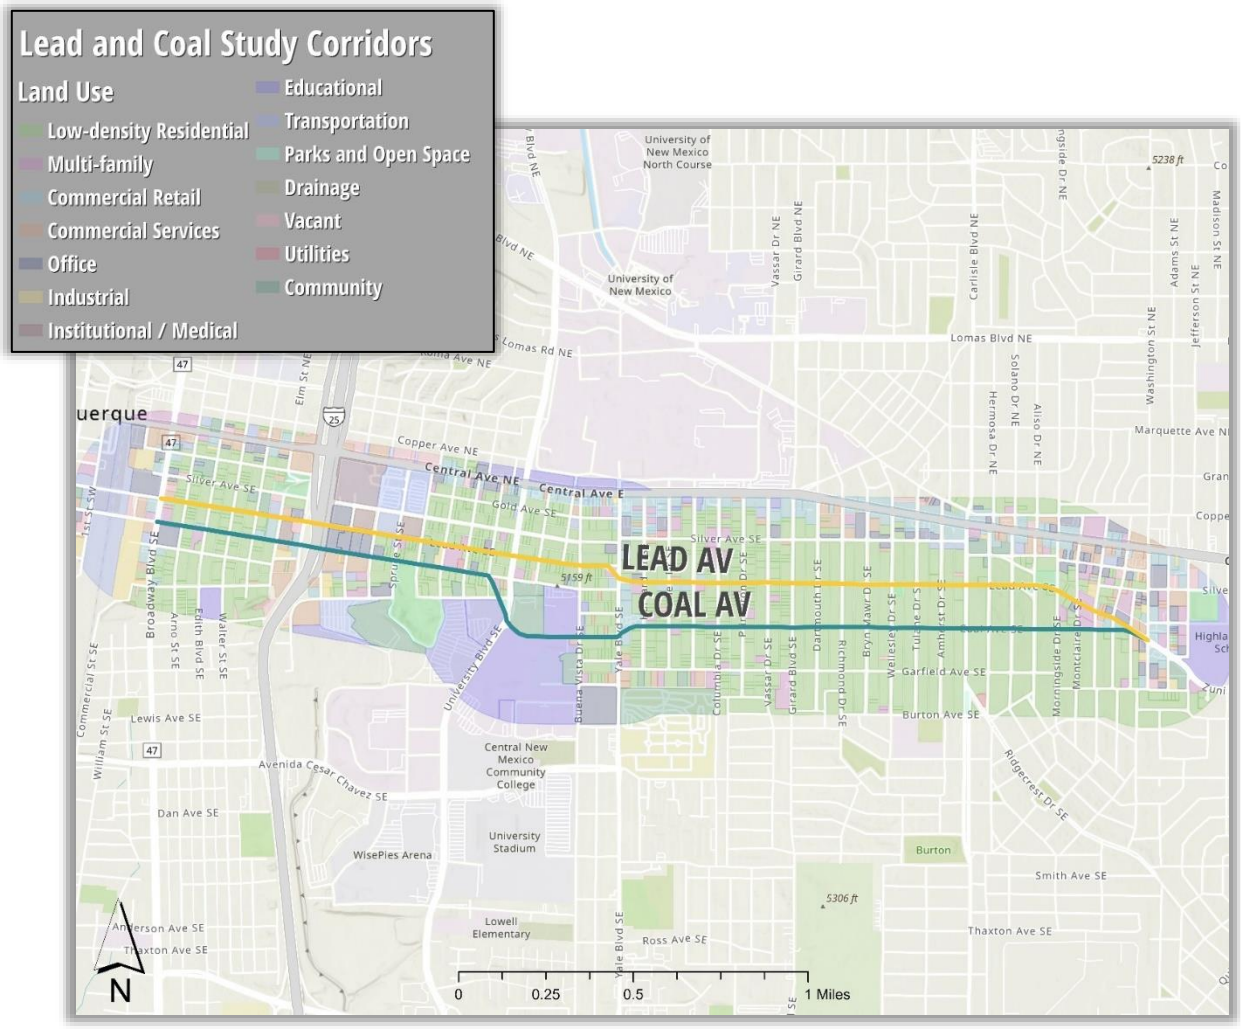

Figure 3: Study Area Adjacent Land Uses

PEDESTRIAN FACILITIES

Pedestrian facilities are currently present along the Lead and Coal corridors. The facilities include detached sidewalks, ADA ramps, crosswalks, and pedestrian push buttons at each signalized intersection. Segments also contain similar pedestrian facility characteristics, including sidewalk widths and attached or detached sidewalks.

Segment 1

Sidewalks on either side of Lead Avenue within Segment 1 are primarily 7-8 feet. The bicycle lane on the north side of Lead Avenue helps to provide a 10-foot buffer, while intermittent parking lanes on the south side of Lead Avenue provide a 9-foot buffer for pedestrians. All crosswalks contain marked crossings and pedestrian push-buttons at signalized intersections. No benches or pedestrian resting facilities are present.

Segment 2

Sidewalks on either side of Lead Avenue within Segment 2 are primarily 7-8 feet and detached. Buffer zones on the north side of Lead Avenue are primarily 14 feet, while buffer zones on the south side of Lead Avenue vary from 4 feet at the Yale Boulevard intersection to 8-18 feet due to intermittent parking lanes. All crosswalks contain marked crossings and pedestrian push-buttons at signalized intersections. There are no benches or pedestrian resting facilities within this segment apart from public transit stop locations at Mesa Street and Cedar Street.

Segment 3

Sidewalks on either side of Lead Avenue within Segment 3 are primarily 7 feet detached. Buffer zones on the north side of Lead Avenue range from 6-16 feet, though 12 feet is standard. Buffer zones on the south side of Lead Avenue vary from 2-8 feet, though 6-8 feet is standard. All crosswalks contain marked crossings and pedestrian push-buttons at signalized intersections. Within this 1.25-mile primarily residential segment, there are four benches for pedestrians and three transit stop locations at Yale Boulevard, Girard Boulevard, and Carlisle Boulevard, each containing a bench.

Coal Avenue Pedestrian Facilities

Segment 1

Sidewalks on either side of Coal Avenue within Segment 1 are typically 7-8 feet and attached. On the north side of Coal Avenue, frequent parking lanes ensure a 10-foot minimum buffer for pedestrians. This is also true on the south side of Coal Avenue, where a bicycle lane provides pedestrians with a 10-foot minimum buffer. All crosswalks contain marked crossings and pedestrian push-buttons at signalized intersections. No pedestrian resting facilities are present.

Segment 2

The 6-to-7-foot-wide sidewalks on either side of Coal Avenue within Segment 2 are nearly equally attached and detached. On the north side of Coal Avenue, pedestrian buffer zones vary from 4-25 feet due to intermittent parking lanes. On the south side of Coal Avenue, pedestrian buffer zones vary from 6-22 feet. The bicycle lane present ensures a minimum 6-foot buffer for pedestrians. All crosswalks contain marked crossings and pedestrian push-buttons at signalized intersections. Apart from public transit stop locations at Spruce Street and University Boulevard, no pedestrian resting facilities are present.

Segment 3

Sidewalks on either side of Coal Avenue within Segment 3 are typically 7-8 feet wide and detached. On the north side of Coul Avenue, pedestrian buffer zones vary from 0-8 feet, though 4-6 feet is most common. A

0-foot buffer zone only occurs occasionally when the sidewalks attach to the roadway in front of homes. Buffer zones on the south side of Coal Avenue range from 6-14 feet, though 6-10 feet is most common. The bicycle lane present ensures a 6-foot buffer for pedestrians as the sidewalk frequently attaches and detaches from the roadway. All crosswalks contain marked crossings and pedestrian push-buttons at signalized intersections. Within this 1.25-mile primarily residential segment, there are four benches for pedestrians and three public transit stop locations at Yale Boulevard, Girard Boulevard, and Carlisle Boulevard, each containing a bench.

Bicycle Facilities

Bicycle lanes throughout the study area are six feet wide on Lead Avenue and Coal Avenue. Exclusive turn lanes are present at Broadway Boulevard, Locust Street, Oak Street, University Boulevard, Yale Boulevard, and Washington Street; the bicycle lanes taper to four or five feet wide at these intersections. A four-foot buffer is present along the bicycle lanes from Broadway Boulevard to Locust Street.

Transit

ABQ Ride Bus Route 97 operates along Lead and Coal Ave. On Lead Avenue, bus stops are available at Broadway Boulevard, Elm Street, Cedar Street, Mesa Street, Yale Boulevard, Girard Boulevard, and Carlisle Boulevard. On Coal Avenue, bus stops are available at High Street, Mulberry Street, University Boulevard, Girard Boulevard, and Carlisle Boulevard.

DATA COLLECTION

Pneumatic Tube Counts

The project team collected pneumatic tube data in April 2024 as a separate effort. This data provided insight into traffic activity in the study corridor. Pneumatic tube counters yielded motor vehicle classifications, traffic volumes, and travel speeds. Figure 4 shows the pneumatic tube deployments. The sections that follow are a sample of the recorded data.

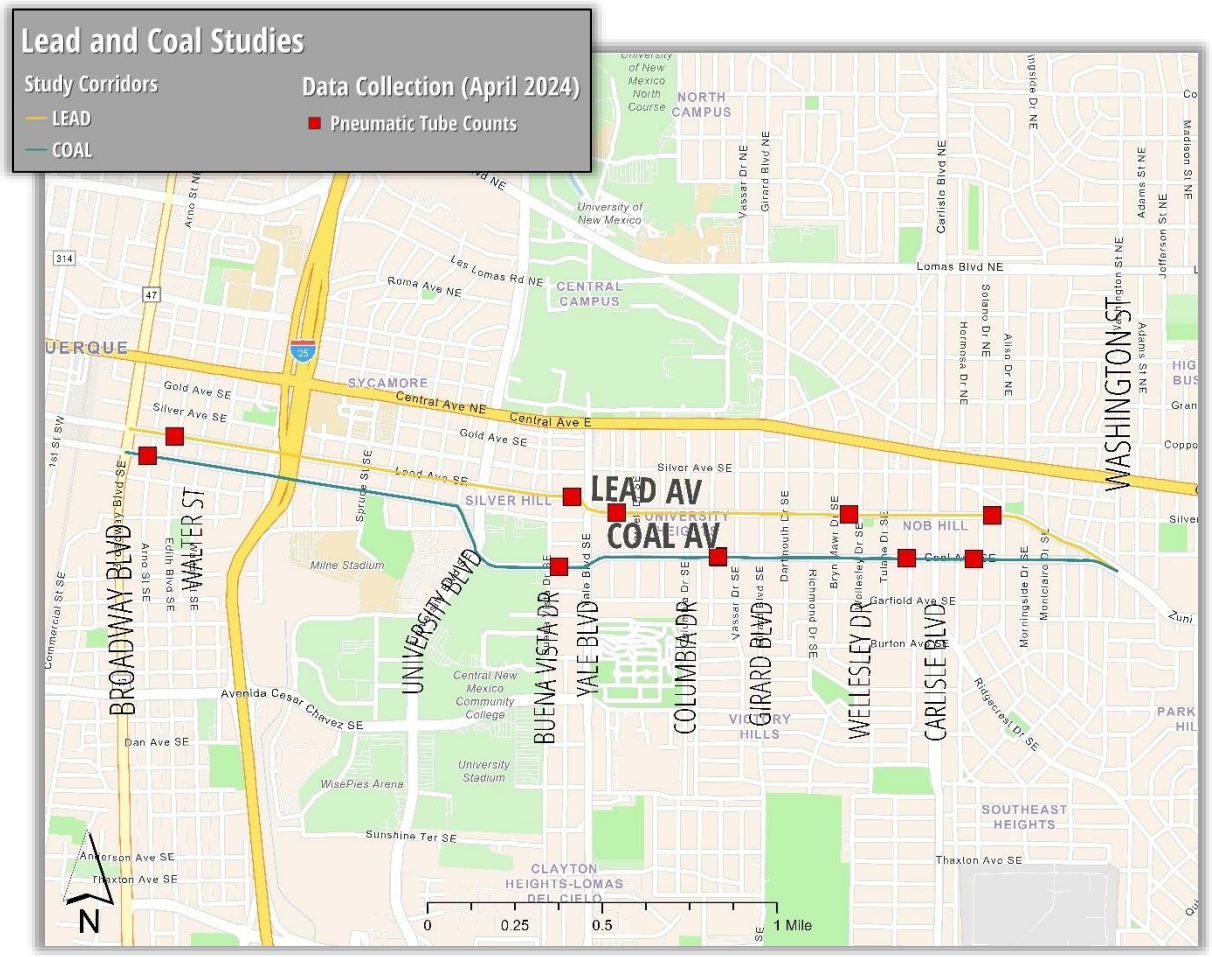

Figure 4: Pneumatic Tube Counts

Coal Avenue – West of Arno Street

Pneumatic tube counts on Coal Avenue to the West of Arno Street collected speeds and vehicle classes. Table 3 and Table 4 summarize the speed and class data.

Table 3: Coal Avenue – West of Arno Street Speed Profile

Pickups, Panels, Vans	1713	16.9%
Single Unit 2-Axle	724	7.2%
Single Trailer <5 Axle	230	2.3%
All Others	184	1.8%

Turning Movement Counts

Turning movement counts for the study intersections were collected for three periods: 6:00 AM to 9:00 AM, 11:00 AM to 2:00 PM, and 3:30 PM to 6:30 PM, in May and June 2024. Turning movement volumes collected at the study intersections show a typical commuter-type distribution with observable AM, MD, and PM peak hours. The peak hours for the entire study area (network peak) are 7:30 AM – 8:30 AM, 12:00 PM to 1:00 PM, and 4:30 PM to 5:30 PM. Figure 5 shows the observed peak hours for each intersection where traffic counts were collected and the peak hours for the entire study area (network peak). Complete turning movement counts can be found in Appendix C. A summary of peak hours by intersection can be found in Appendix B.

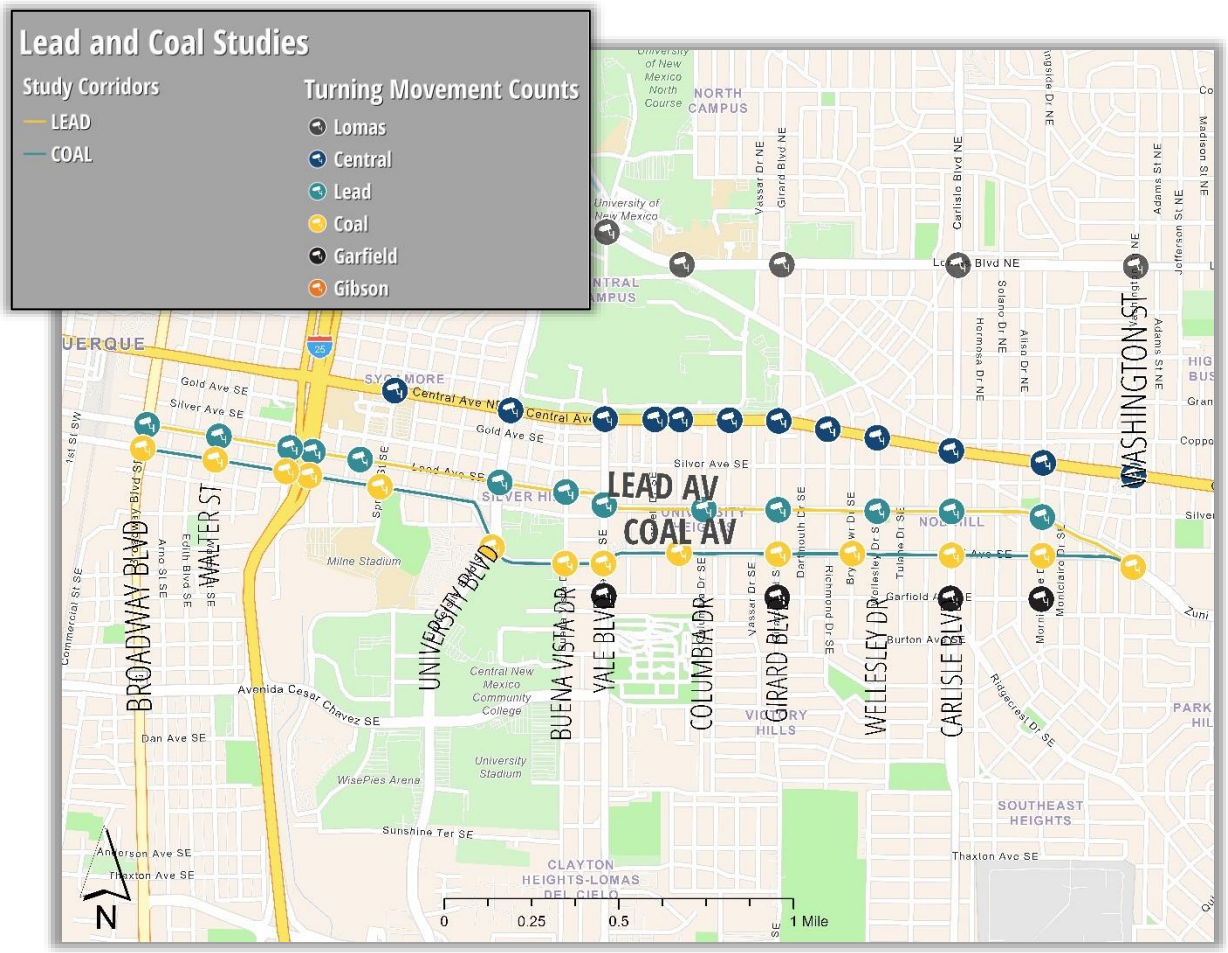

Figure 5: Turning Movement Counts

SAFETY ASSESSMENT

Crash Data Limitations

Crash data is extracted from reports filed with or by law enforcement agencies and is subject to variations in reporting based on the officer's interpretation of the Uniform Crash Report (UCR). Known challenges with crash data include excluding crashes below property damage thresholds, unreported crashes, near-misses, and geolocation accuracy.

Crash Analysis

This study analyzed five years of crashes occurring in the study corridor between 2018 and 2022 provided by the City of Albuquerque. This crash dataset is the most recent available and contains 1,475 crashes: 751 on Lead and 724 on Coal. Figure 6 shows a heat map of the reported crashes in the study corridors.

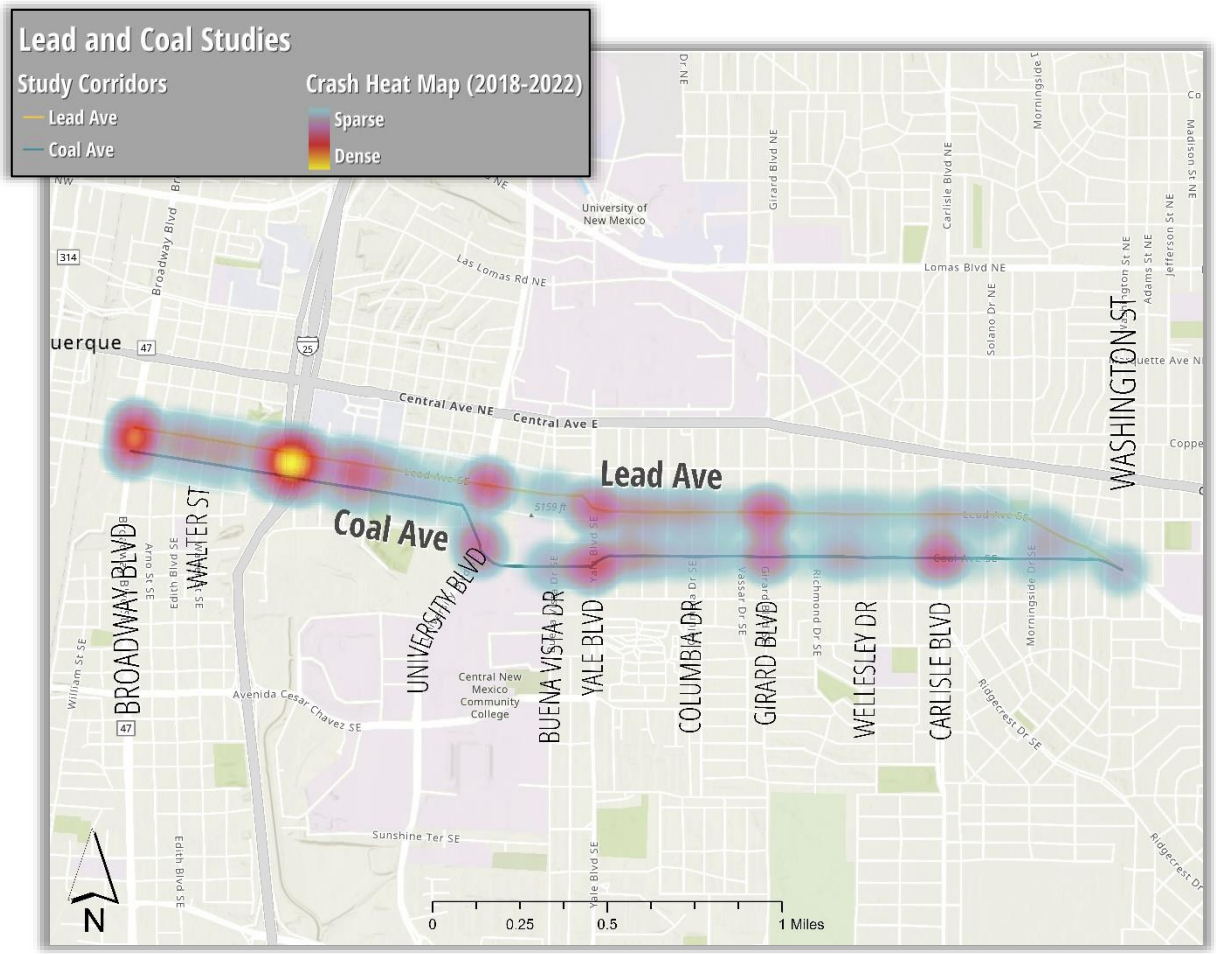

Figure 6: Lead & Coal Crash Heat Map (N=1,475), 2018-2022

Severity

The KABCO scale classifies the severity of crashes in New Mexico. The letters in KABCO represent the severity of a crash:

- K – Killed (Fatal)
- A – Incapacitated (Serious Injury)
- B – Minor Injury
- C – Complaint of Injury (Suspected Injury)
- O – No Apparent Injury (Property Damage Only)

This study reviewed five years of crash data. During that time, there were 1,475 crashes; five were Fatal (K), 19 resulted in Serious Injuries (A), and 1,451 crashes resulted in Minor Injuries (B), Suspected Injuries (C), or Property Damage Only (O). Four fatal crashes occurred on Lead and one on Coal. Three Fatal crashes involved pedestrians, and one involved a motorcycle. Additionally, three bicyclist-involved crashes resulted in Serious Injuries. Figure 7 illustrates the crashes in the study area by location and severity.

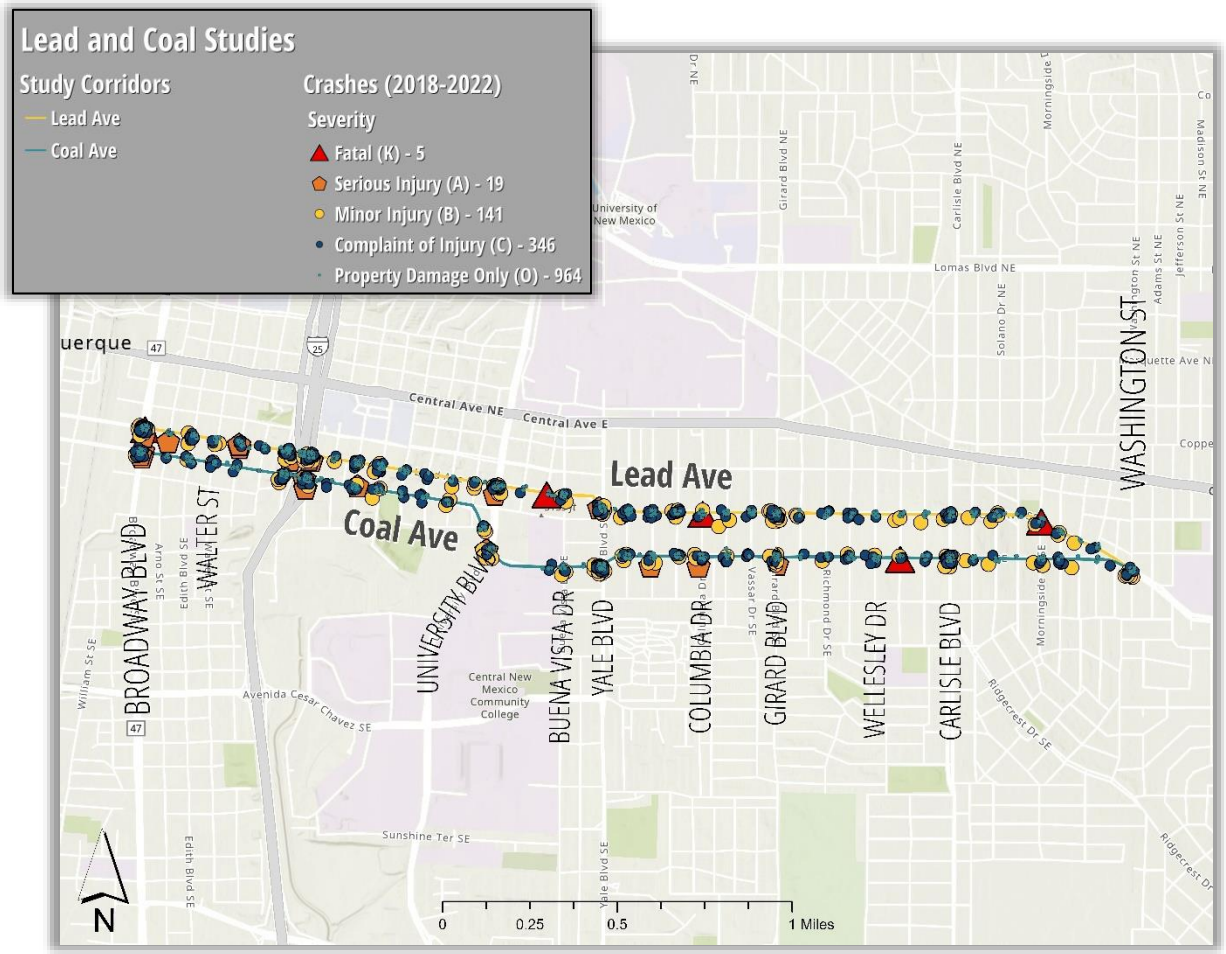

Figure 7: Crashes by Severity (N=1,475), 2018-2022

Crash Rates Comparison

Comparing crash rates across similar facilities provides valuable insights into safety challenges, establishes performance benchmarks, and identifies crash patterns. Since facility types vary in traffic volumes, design, and usage, normalizing crash rates ensures accurate comparisons. These comparisons can aid decision-makers in allocating resources by prioritizing locations with significantly higher crash rates than their peers.

Lead and Coal Avenues are unique in that they are one-way couplets and principal arterials, meaning that they are designed to provide a high level of mobility, serve major activity centers, and carry high vehicle capacities that enter and leave an area. The project team looked for similar facilities based on functional class, facility type, posted speed limit, and traffic volumes. The comparison corridors all have a functional class of principal arterial. However, two are one-way couplets, and the others allow two-way traffic. Table 11 shows the attributes of Lead and Coal Avenues and four comparison corridors. The crash rate comparison of the study corridors to roads with similar attributes proved futile and did not represent the residents' lived experience.

Table 11: Crash Rate Comparison Corridors

	Lead/Coal Aves	2nd/3rd Sts	Lohman/Amador Aves (Las Cruces)	Broadway Blvd	Unser Blvd
Functional Class	Principal Arterial	Principal Arterial	Principal Arterial	Principal Arterial	Principal Arterial
Facility Type	One-way Couplet	One-way Couplet	One-way Couplet	Two-way	Two-way
Speed Limit	30 MPH	35 MPH	35 MPH	35 - 40 MPH	25 - 40 MPH
Traffic Volume	7,096-11,812 (one-way)	3,523-6,179 (one-way)	5,033-15,492 (one-way)	11, 108–22,201 (Bidirectional)	10,224–21,985 (Bidirectional)
Travel Lanes (Each Direction)	2	2	4	2	2
N/E Extent	Washington St	Indian School Rd	Lujan St	Iron Ave	Bridge Blvd
S/W Extent	Broadway Blvd	Lomas Blvd	Miranda St	Woodward Rd	Dennis Chavez Blvd
Length (mi.)	2.90, 2.97	1.01, 1.03	1.24, 1.24	2.14	3.38

Signalized Intersections

This study compared crash rates for signalized intersections and various crash types across each road segment. For signalized intersections, the project team determined crash rates for all crash types by calculating the crash rate for the number of crashes per million entering vehicles described in the following equation:

$$MEV = \frac{C * 1{,}000{,}000}{V * N * 365}$$

Where:

$C = Number\ of\ crashes\ in\ the\ study\ period$

$V = Traffic\ volume\ entering\ the\ intersection\ daily\ (AADT)$

$N = Number\ of\ years\ of\ data$

This rate represents the number of crashes occurring at an intersection per one million vehicles that enter over a specified period; in this study, we use five years of crash and traffic data. Table 12 summarizes the average intersection crash rate for each corridor.

Table 12: Average Signalized Intersection Crash Rates

	Lohman/Amador Aves (Las Cruces)	2nd/3rd St.	Lead/Coal Aves	Unser Blvd	Broadway Blvd
Signalized Intersection (MEV)	1.6	1.56	1.46	1.38	1.22

Road Segments

For road segments, the project team determined crash rates for speed-involved crashes, crashes identified as occurring Off-Roadway, and Fixed Object crashes by calculating the crash rate for the number of crashes per 100 million vehicle miles traveled described in the following equation:

$$100MVMT = \frac{C * 100{,}000{,}000}{365 * V * N * L}$$

Where:

$C = Number\ of\ crashes\ in\ the\ study\ period$
$V = Traffic\ volume\ entering\ the\ intersection\ daily\ (AADT)$
$N = Number\ of\ years\ of\ data$
$L = Length\ of\ the\ road\ segment\ in\ miles$

Speed-involved crashes are those in which the crash report identifies "Excessive Speed," "Speed Too Fast for Conditions," or "High-Speed Pursuit" as contributing factors. Crashes occurring "Off-Roadway" are identified by the variable "First Harmful Event Occurrence" with the attribute "Off-Roadway." This variable identifies the location of where the crash occurred in, whether it occurred on the road or off the roadway, i.e., shoulder, median, roadside, sidewalk, etc. Fixed object crashes comprise crashes in which the "Crash Analysis" variable indicates the collision occurred with a Parked Vehicle, Light Pole, Building, Traffic Signal, Fence, Median/Curb, or Signpost, or the crash was a Rollover. The Lead and Coal corridors fall in the middle of the pack for speed-involved and fixed object crash rates and have the second lowest crash rate for crashes where the First Harmful Event occurs off the roadway.

Table 13: Segment Crash Rates

	2nd/3rd St.	Broadway Blvd	Lead/Coal Aves	Lohman/Amador Aves (Las Cruces)	Unser Blvd
Speed-Involved Crashes (100 MVMT)	46.95	19.41	10.26	8.81	8.28
FHE - Occurrence: Off-Roadway (100 MVMT)	7.82	4.53	2.84	3.20	1.26
Fixed Object Crashes (100 MVMT)	36.52	8.41	7.89	5.20	6.66

Crash Rate Comparison Summary

The crash rate comparison indicated that Lead and Coal Avenues did not indicate a significant problem compared to similar corridors. However, similar is a relative statement since Lead and Coal Avenues are unusual in that they abut many residences. As such, the project team assessed crashes exclusively within the Lead and Coal corridors. The following sections explore crashes on Lead and Coal Avenues.

Year

Crashes were at their highest in 2018 and slightly dipped in 2019. Between 2019 and 2020, a 30% decrease was realized, likely resulting from the impacts of travel and driver behavior caused by COVID-19. Crashes began to increase again in 2021 and fell in 2022, although there were still more crashes than in 2020. Figure 8 shows crashes per year between 2018 and 2022.

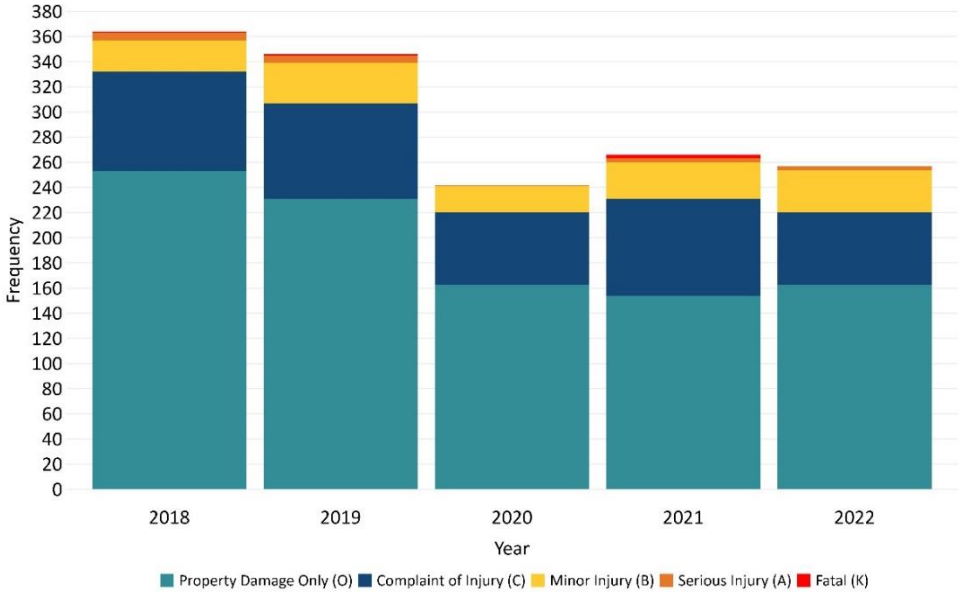

Figure 8: Crashes per Year, 2018-2022

Month

Crash frequency is highest in August but gradually declines through December. January through July experiences fluctuation in crashes with peaks in March and June. Fatal crashes occurred from October through December, peaking in November. Monthly crash trends by corridor echo the aggregated crash trends in Figure 9.

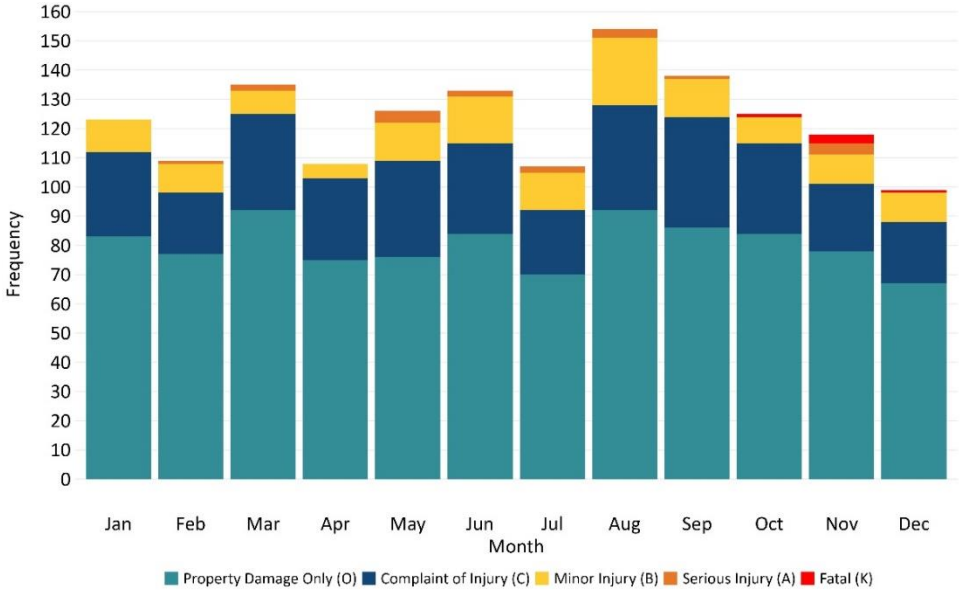

Figure 9: Crash Severity by Month, 2018-2022

Day of Week

Crash frequency increases from Sunday through Saturday, with most occurring on Friday. Crashes are relatively consistent between Tuesday and Friday. Fewer crashes on Sunday and Monday suggest less traffic. Additionally, crash severity proportions are consistent throughout the week, but the proportion of Minor Injuries, Serious Injuries, and Fatalities is highest on the weekend. Figure 10 shows crashes and severity by day of the week.

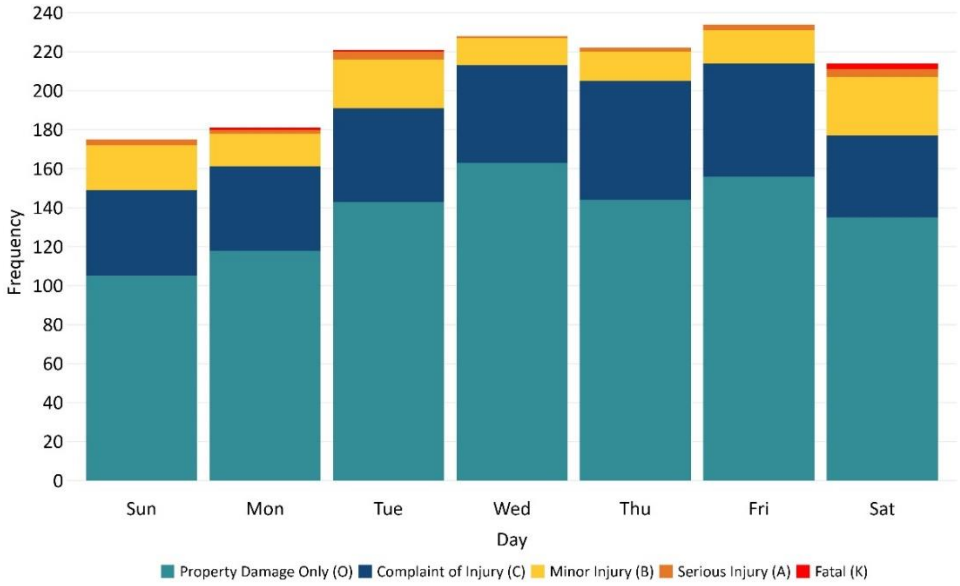

Figure 10: Crash Severity by Day of the Week, 2018-2022

Time of Day

The crash frequency per hour echoes daily traffic, increasing with traffic volume. Crashes are lowest between 12:00 AM and 5:00 AM. Crashes increase significantly after 6:00 AM, peaking between 11:00 AM and Noon. An afternoon peak occurs from 3:00 PM to 5:00 PM. After 6:00 PM, crashes decrease through midnight. The AM peak is primarily concentrated around 11:00 AM, while the afternoon peak spans from 3:00 PM to 5:00 PM. Figure 11 highlights how crash frequency tends to increase during peak traffic hours.

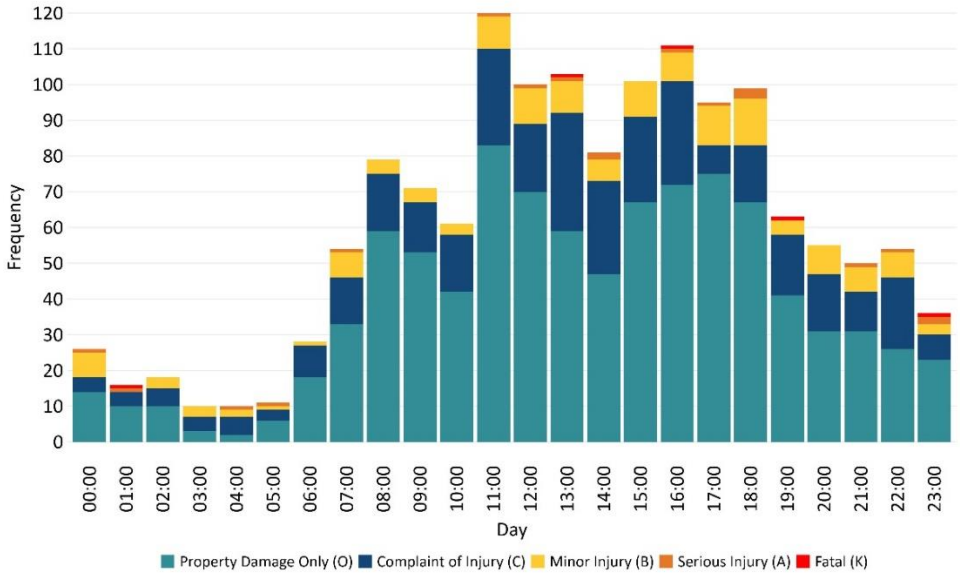

Figure 11: Crash Severity by the Time of Day, 2018-2022

Lighting Condition

Most crashes (~87%) occur under Daylight or Dark-Lighted conditions. These trends suggest that inadequate lighting is not a significant contributor to crashes of Lead or Coal. Figure 12 is a proportional bar chart summarizing crashes by lighting condition.

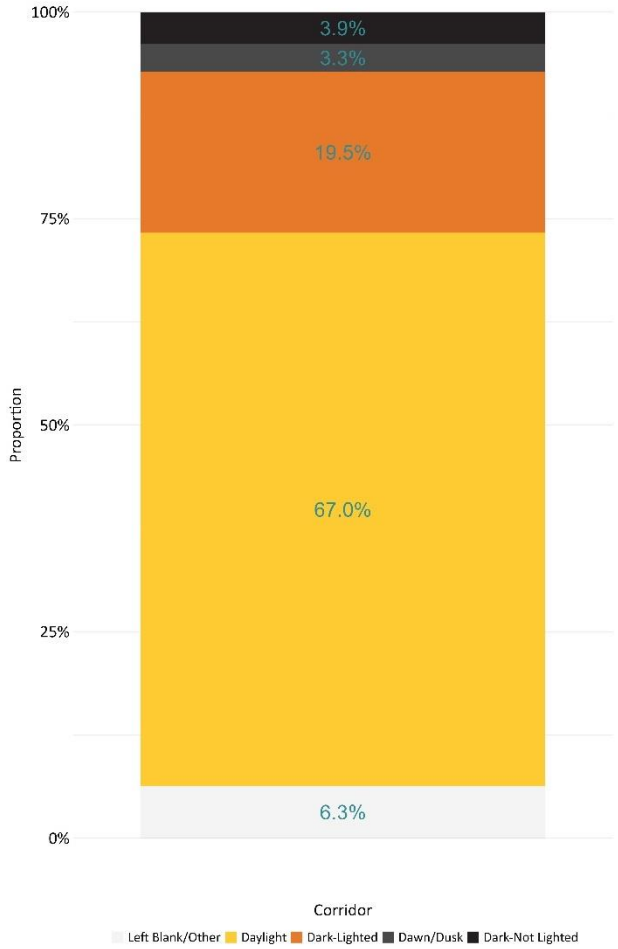

Figure 12: Crash Proportions by Lighting Condition

Signalized Intersection Crash Rates

Crash rates per MEV for all crash types are calculated for significant intersections in the study corridors. The intersections with the highest crash rates are Coal Avenue and Carlisle Boulevard, Lead Avenue and Girard Boulevard, and both Oak Street intersections. Other notable intersections are Yale, Lead Avenue, and University Boulevard. Figure 13 shows the intersection crash rates for significant Lead and Coal Avenues intersections.

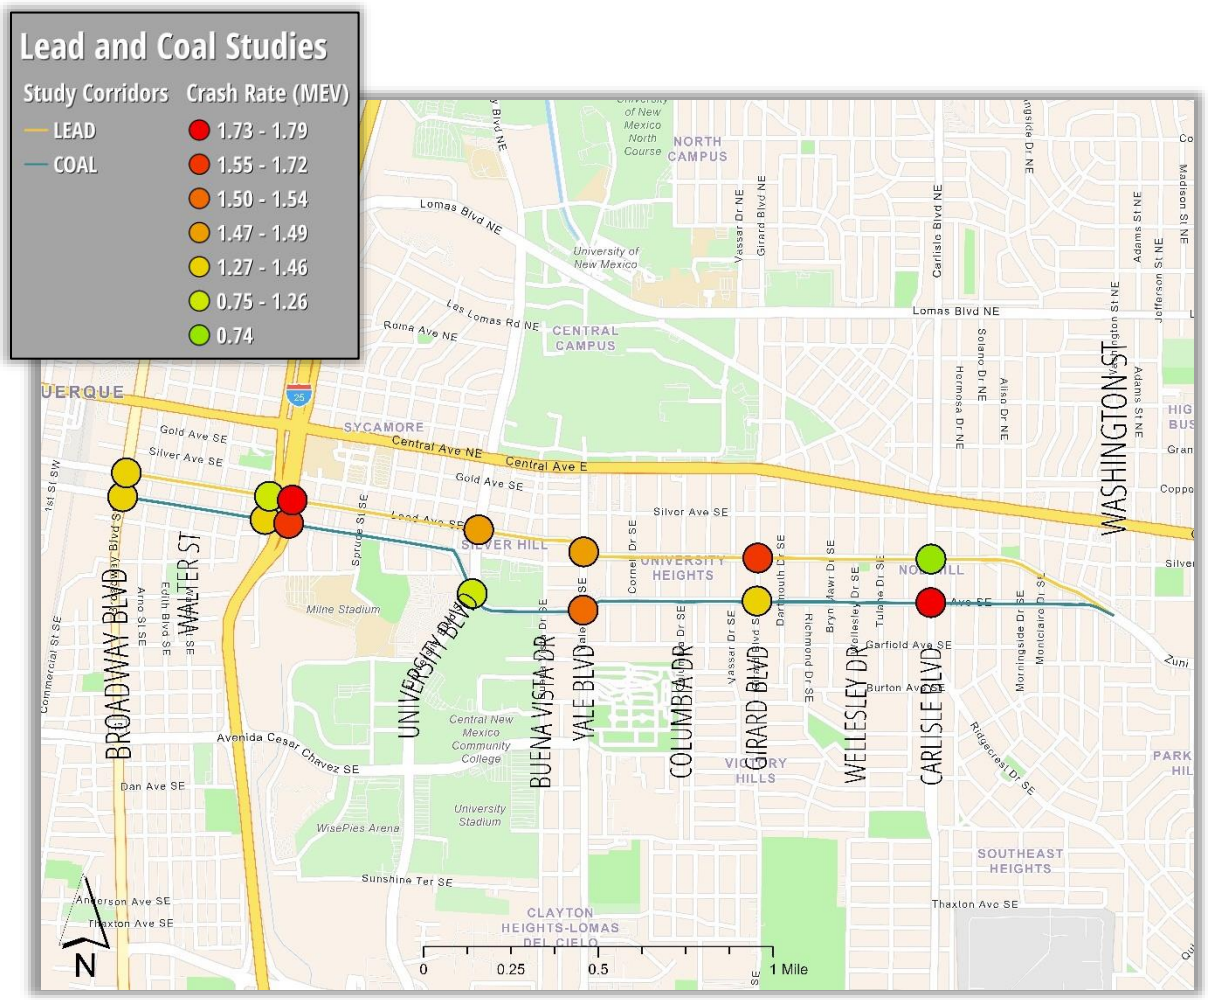

Figure 13: Signalized Intersection Crash Rates for Lead and Coal Avenues

Speed-Involved Crashes

Speed is a factor in crashes that directly affects crash severity. The kinetic energy of a vehicle of mass (m) traveling at speed (v) is 1/2mv2, meaning that higher speeds lead to much more significant impact forces, increasing the risk of fatal and severe injury crashes. Managing speed is critical to eliminating severe crash outcomes. Speed-related crashes are interpreted as crashes in which the contributing factor is reported as "Excessive Speed," "*High-Speed Pursuit,"* or *"Speed Too Fast for Conditions."* However, speed may not be attributed to every crash where it was a contributing factor. Speed contributes to nearly nine percent of crashes in the study area. This dataset indicates that speed contributed to one fatal and four serious injury crashes. Figure 14 shows the locations of speed-involved crashes in the study corridors.

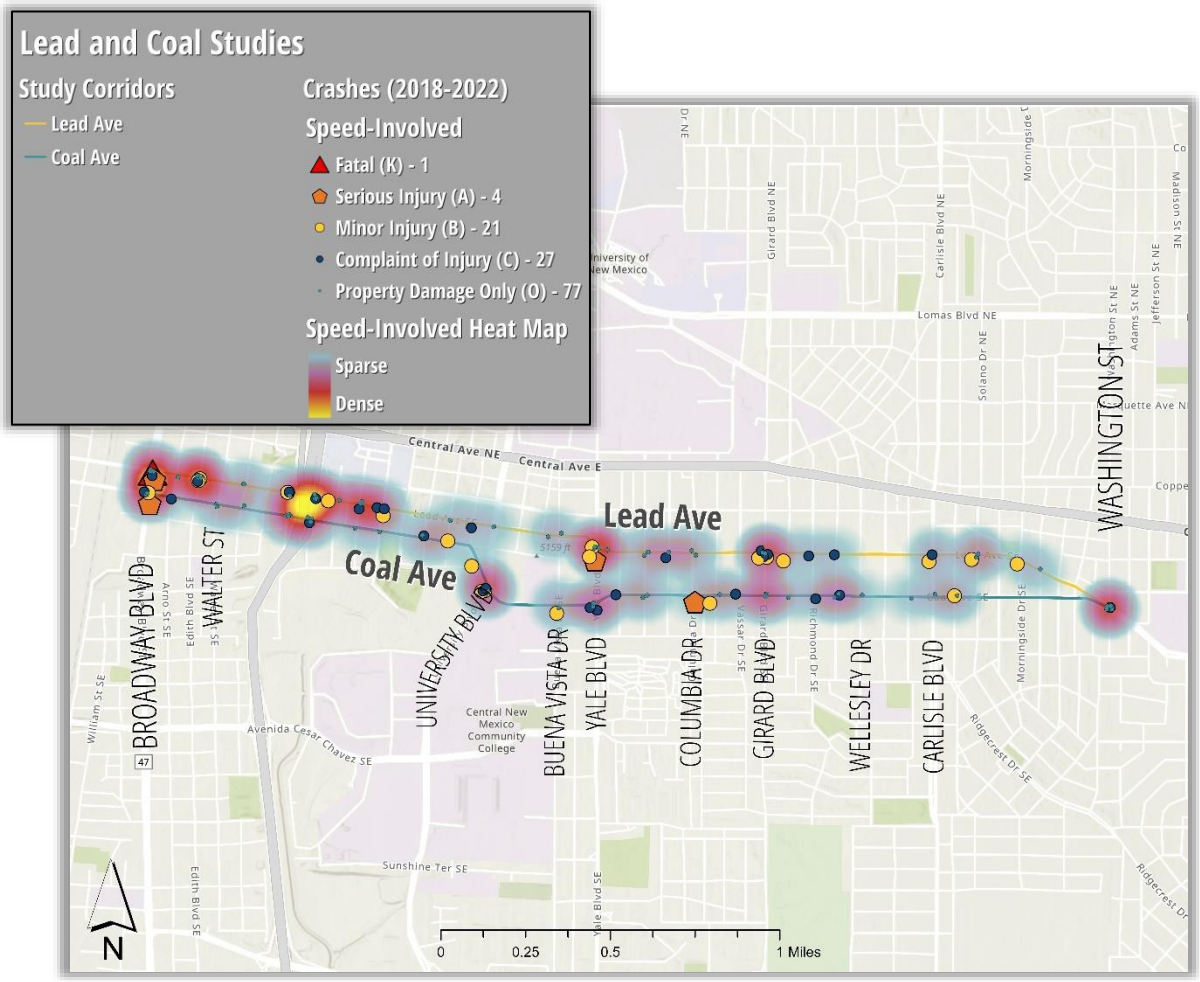

Figure 14: Speed-involved Crashes Heat Map, 2018-2022

Multimodal Crashes

Pedestrians, bicyclists, and other vulnerable road users are subject to more significant consequences when involved in a motor vehicle crash. Figure 15 is a proportional bar chart showing the proportion of transportation mode involvement by crash severity.

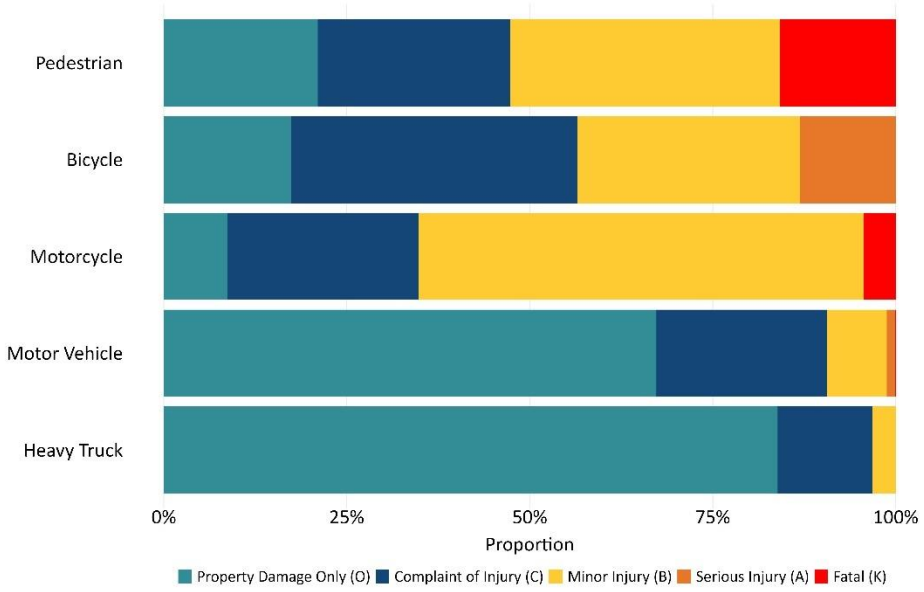

Figure 15: Proportion of Crash Severity by Mode of Transportation, 2018-2022

Manner of Impact

A crash's reported Manner of Impact regarding the First Harmful Event describes how the road users collided. Documenting the Manner of Impact of the First Harmful Event was introduced in 2020 on New Mexico's Uniform Crash Report. Our crash data spans from 2018 to 2022. Crashes before 2020 did not have this data reported, so the proportion of Left Blank/Other is sizeable. Of the crashes containing this data, Front-to-Rear crashes, rear-end collisions, and Front-to-Side crashes, or T-bone crashes, are the most common. Figure 16 summarizes the number of crashes by manner of impact.

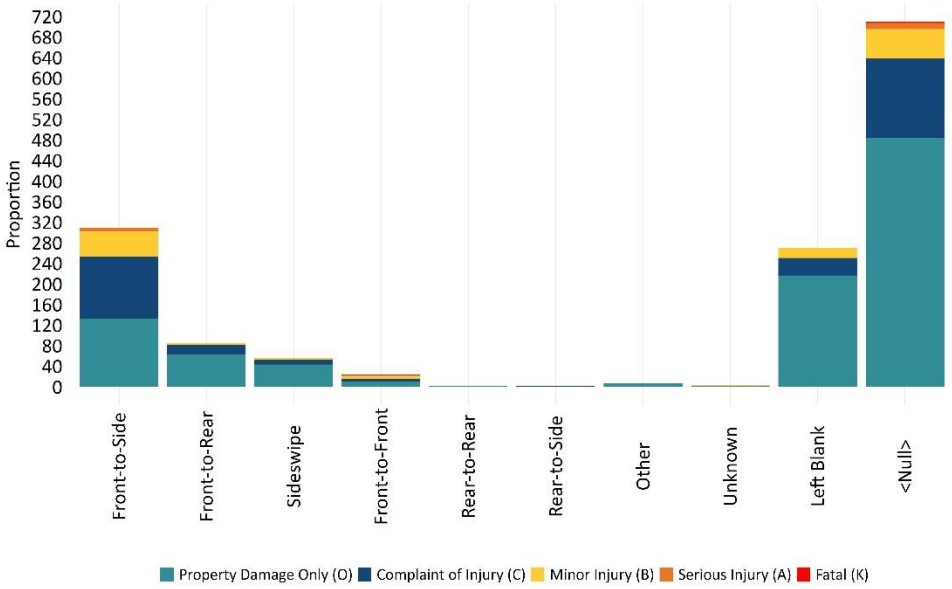

Figure 16: Crash Severity by First Harmful Event – Manner of Impact, 2018-2022

Alcohol Involvement

Alcohol impairs a driver's reaction time, judgment, and coordination, increasing a crash's likelihood and severity. On Lead and Coal Avenues, alcohol-involved crashes comprise 3.5% of all crashes in the corridors. However, alcohol-involvement comprises 16.7% of Fatal and Serious Injury crashes. While alcohol is disproportionately represented in the most severe crashes on Lead and Coal Avenues, this proportion is in line with the proportion of all alcohol-involved crashes resulting in Fatal and Serious Injuries in Bernalillo County. Table 14 summarizes alcohol involvement by crash severity for the study corridors and Bernalillo County.

Table 14: Alcohol involvement by crash severity

	Lead & Coal			Bernalillo County		
	Alcohol Involved	Total	Proportion	Alcohol Involved	Total	Proportion
Fatal (K)	1	5	20.0%	203	529	38.4%
Serious Injury (A)	3	19	15.8%	115	1,352	8.5%
Fatal (K) & Serious Injury (A)	4	24	16.7%	318	1,881	16.9%
Minor Injury (B)	12	141	8.5%	554	7,300	7.6%
Complaint of Injury (C)	10	346	2.9%	702	17,304	4.1%
Property Damage Only (O)	26	964	2.7%	1,733	57,173	3.0%
Total	52	1,475	3.5%	3,307	83,658	4.0%

Crash Summary

Between 2018 and 2022, crash trends fluctuated, peaking in 2018 before dipping in 2019, followed by a 30% decline in 2020, likely due to COVID-19-related travel behavior changes. August has the highest crash frequency, with peaks in March and June, while fatal crashes peak in November. Crashes increase throughout the week, peaking on Fridays, though severe and fatal crashes are most common on Saturdays. The highest crash rates occurred at Coal Ave & Carlisle Blvd, Lead Ave & Girard Blvd, and both Oak St intersections. Crash frequency mirrors daily traffic patterns, with peaks between 11:00 AM - 12:00 PM and 3:00 PM - 5:00 PM. Most crashes occurred in daylight or well-lit conditions. Speed was a factor in approximately 9% of crashes and resulted in one fatal and four serious injury incidents. Rear-end and T-bone collisions were the most common impact types from the Manner of Impact data, but this data does not represent most of the dataset. Alcohol contributes to 3.5% of crashes in the study corridors and to nearly 17% of Fatal and Serious Injury crashes. Additionally, vulnerable road users like pedestrians and bicyclists experience disproportionate crash severity.

Crash Reports

The crash data analysis provided insight into Lead and Coal's challenges. However, feedback from the working group and the first public meeting indicated that this data was not representative of the crashes that residents were experiencing. The project team reviewed crash reports from the corridors that occurred in 2023 and 2024, intending to gain a better understanding of the written police reports. Some emerging trends were crashes involving vehicles moving at high speeds, Red Light Running, and Left turns from the right lane and vice versa. The crash diagram in Figure 17 shows a vehicle turning left from the right lane.

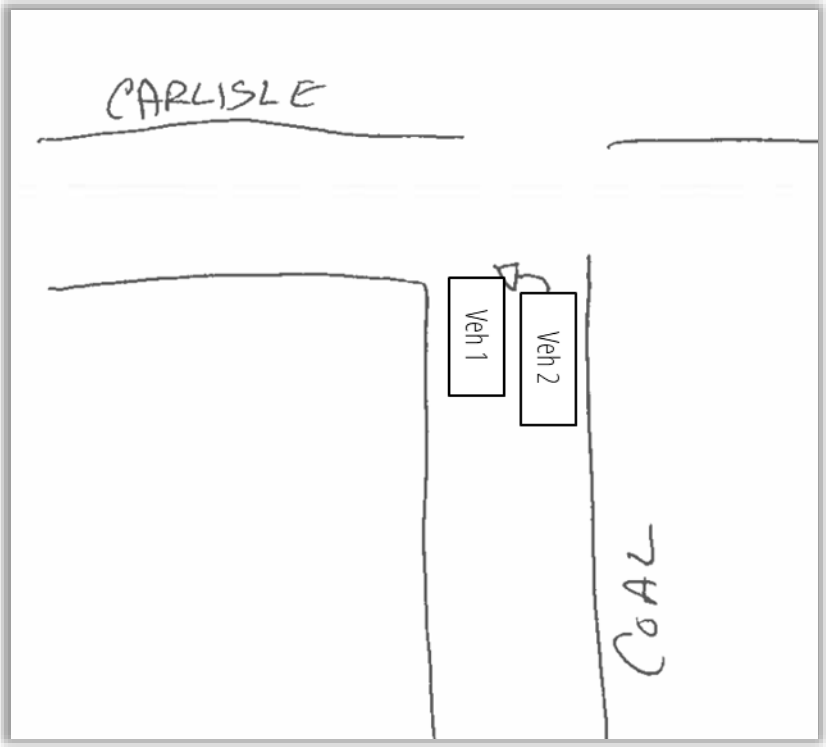

Figure 17: Crash Diagram of Vehicle Making Left Turn from the Right Lane.

Predictive Crash Method

Using the Highway Safety Software (HSS), crash prediction evaluations were performed for the study corridors. Table 15 and Table 16 compare the observed, expected, and predicted crash rates for Lead and Coal Avenues. **Observed** crashes are the historical crashes documented in this study's crash data between 2018 and 2022. The Predictive Method from the Highway Safety Manual (HSM) uses the geometric and safety features of each intersection or facility to calculate a Safety Performance Function (SPF) Crash Modification Factors (CMF) to estimate a **predicted** crash frequency. Additionally, HSS uses an Empirical Bayes analysis that combines the observed crash frequencies with the predicted crash frequencies from similar sites to estimate the **expected** crash frequency. The predicted and expected crash frequencies can then be compared to the observed annual crashes to identify areas experiencing safety issues. Complete reports for both sections from the HSS software can be found in Appendix F.

New Mexico has lower thresholds for reporting property damage-only crashes at $500 compared to other states, such as $1000 in Texas, which may contribute to high crash reporting and, thus, a high expected crash rate. New Mexico may have higher reporting rates for property damage-only crashes, higher crash frequencies, or a combination of both. Additionally, the segment analyses aggregate crashes from stop-controlled minor streets and signal-controlled intersections where traffic volume data is unavailable.

The key takeaway from Table 15 and Table 16 is the observed crash rate exceeds the Predicted and Expected crash rates for Lead and Coal Avenues at every intersection and segment analyzed.

Table 15: HSS Analysis Results for Lead Ave

Street	Section Type	Location	Observed Crash Rate (Crashes/year)	Predicted Crash Rate (Crashes/ year)	Expected Crash Rate (Crashes/year)
Lead	Intersections	Lead & Carlisle	4.2	2.6	3.4
		Lead & Girard	11.0	2.6	0.7
		Lead & Yale	9.6	3.3	7.9
		Lead & University	11.0	4.4	9.5
		Lead and Oak	12.6	3.4	10.1
		Lead and Locust	7.8	3.5	6.4
		Lead & Broadway	12.4	3.8	10.0
	Segments	Washington to Carlisle	11.6	3.3	4.7
		Carlisle to Girard	10.6	2.8	4.2
		Girard to Yale	20.8	3.6	7.3
		Yale to University	4.8	2.1	2.6
		University to Oak	18.4	3.9	7.2
		Oak to Locust	1.6	0.3	0.5
		Locust to Broadway	13.8	2.7	4.9

Table 16: HSS Analysis Results for Coal Ave

Street	Section Type	Location	Observed Crash Rate (Crashes/year)	Predicted Crash Rate (Crashes/ year)	Expected Crash Rate (Crashes/year)
Coal	Intersections	Coal & Broadway	9.8	3.4	7.9
		Coal & Locust	7.2	2.5	5.7
		Coal & Oak	9.8	2.6	7.6
		Coal & University	9.2	4.4	8.4
		Coal & Yale	11.8	3.4	9.5
		Coal & Girard	9.0	2.6	7.1
		Coal & Carlisle	11.0	2.6	8.2
	Segments	Broadway to Locust	7.8	2.5	3.5
		Locust to Oak	0.8	0.4	0.5
		Oak to University	17.4	4.5	7.4
		University to Yale	5.4	1.6	2.1
		Yale to Girard	17.2	3.1	5.9
		Girard to Carlisle	12.0	3.0	4.6
		Carlisle to Washington	8.0	3.1	3.8

PUBLIC ENGAGEMENT

Throughout the project, Lee Engineering engaged with the public in several ways to ensure interested parties could provide information and receive progress updates. Progress updates were provided via a Working Group, a Task Force, and Public Meetings with corresponding comment forms.

WORKING GROUP

The City of Albuquerque and the Lead and Coal residents initially formed the Working Group to ensure a direct connection to Mayor Tim Keller and his team. This allowed Mayor Keller and his team to discuss the project and other Lead and Coal corridor topics with the residents. Meetings with the Working Group were held once a month.

TASK FORCE

The City of Albuquerque and the Lead and Coal residents developed a taskforce team to track project progress and provide support for public engagement. This team has ensured the continuation of the Lead and Coal improvements and obtained funding for the study's completion. Residents in the Task Force also provided insight into their experiences on the Lead and Coal corridors. Meetings with the Task Force were held bi-weekly over Zoom.

PUBLIC MEETINGS

The Lead and Coal Studies Task Force hosted three public meetings to update interested parties and gather insight from residents. Meetings were held at the Heights Community Center from 6:00 PM to 8:00 PM on September 5, 2024, November 14, 2024, and December 18, 2024. Food and drink were provided for attendees. Public meeting fliers were distributed via Task Force and City Council members. The first two meetings included progress updates and discussions of the methodologies used for analysis. The third meeting provided the analysis results, cost estimates, and implementation options for the alternative design options.

Figure 18: Public Meeting #1

Public Comments

Survey Forms

During the public meetings, attendees could provide feedback via a physical survey form. These forms included a box for input and a QR code for an online survey. Figure 19 shows the in-person survey form from the third public meeting. Four written responses were received from all three public meetings. All public comments can be found in Appendix D.

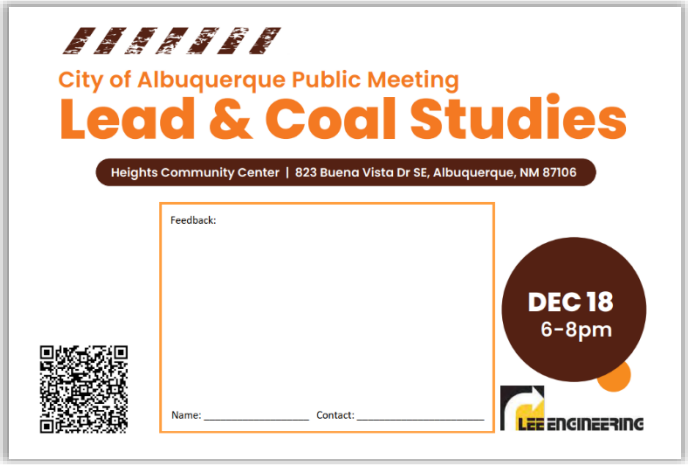

Figure 19: In-Person Survey Form

Online Survey

An online form was also available for all three public meetings, and attendees were provided a hard copy. Attendees were also encouraged to invite their neighbors to fill out the forms if they could not attend.

Each survey included questions that allowed residents to critique the presentation and provide feedback on the study's progress. Some residents also elected to provide their contact information to receive future updates and presentation materials.

Public Meeting 1

The survey from Public Meeting 1 received three online responses. Respondents expressed their confusion with the material presented. One respondent felt the comparisons were flawed and that some should be discarded. They also expressed that more qualitative data should be used to make decisions. Some respondents also expressed concerns about developments along the corridors.

Public Meeting 2

The survey from Public Meeting 2 received 11 online responses. Respondents expressed discontent with the colors of the materials. They expressed the contrast between the slide colors, and the lighting in the room made it difficult to see. Many respondents discussed safety issues they've witnessed, and several preferred the single-lane operation. Some respondents opposed the single-lane operation and were concerned about the impact on Garfield Avenue.

Public Meeting 3

The survey from Public Meeting 3 received four online responses. The responses had mixed opinions on the single-lane operation. One respondent felt the single-lane option would eliminate drag racing and property damage from crashes and reduce speed. Another respondent opposes the single-lane operation as it would delay their business operations. Similarly, a respondent opposed the two-way operation as they perceived it would create congestion and unsafe turning maneuvers.

CORRIDOR SAFETY ALTERNATIVES

Lee Engineering analyzed three safety alternatives for the Lead and Coal Corridors. These alternatives included reducing the posted speed limit, operating single-lane roads, and converting Lead and Coal Avenues to bidirectional roads.

Lee Engineering conducted a segmented analysis to identify areas where alternative design options may be more beneficial. As discussed earlier in this report and shown in Figure 2, the corridors were split into three segments based on the adjacent land use, roadway geometry, and traffic volumes. The Lead and Coal corridors were segmented in the following manner:

- Segment 1: Broadway Boulevard to Interstate 25
- Segment 2: Interstate 25 to Yale Boulevard
- Segment 3: Yale Boulevard to Washington Street

POSTED SPEED LIMIT SPEED REDUCTION

A speed reduction along the Lead and Coal corridors will involve reducing the speed to 25 MPH and installing regulatory signage to increase driver awareness. Currently, the signals on the Lead and Coal corridors are timed for 30 MPH and would need to be retimed for 25 MPH by a licensed Professional Traffic Operations Engineer (PTOE). Figure 20 is a rendering of the existing typical section. This rendering is based on the block of Lead Avenue between Bryn Mawr and Wellesley Drives. Some dimensions vary through the corridors; however, this section is relatively representative of the study corridors.

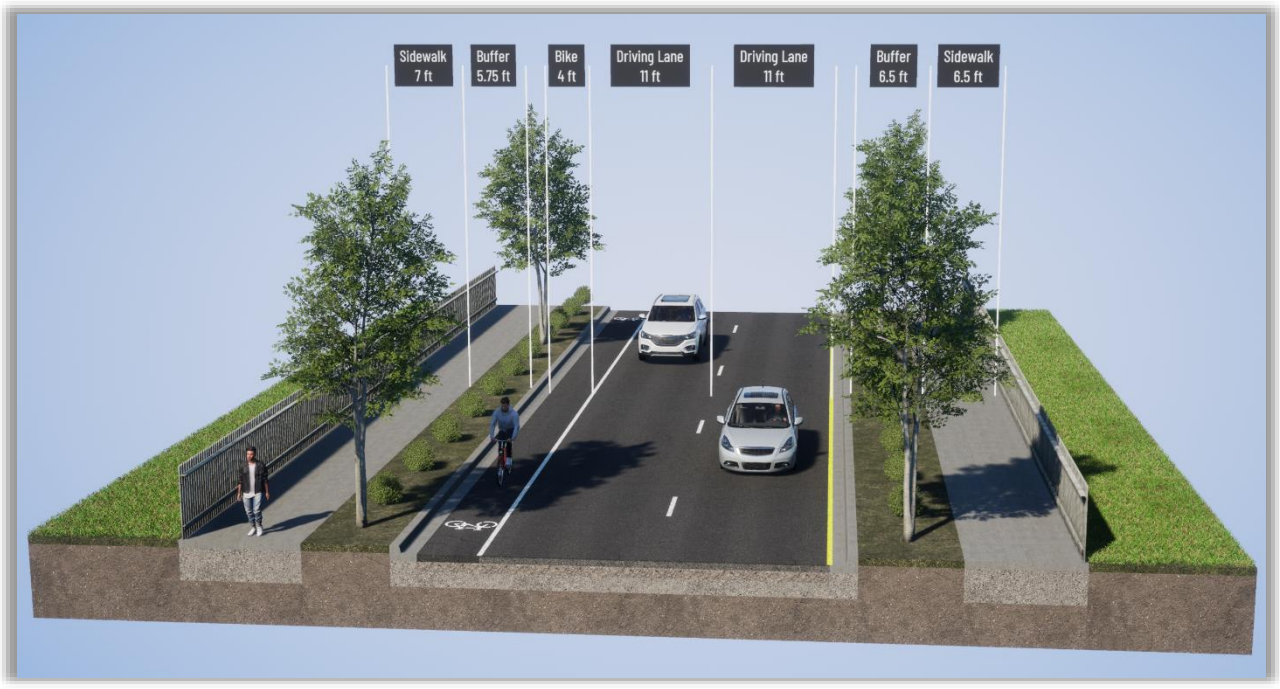

Figure 20: Existing Typical Section

Single-Lane Operation

A single-lane operation along the Lead and Coal corridors will reduce the number of east and westbound lanes from two to one. One concept for a typical section under a single-lane configuration could comprise a buffered 5-foot bicycle lane with a 3-foot buffer, a 10-foot driving lane, and an additional 10-foot buffer, as shown in Figure 21The City of Albuquerque's Development Process Manual indicates that the minimum width of a travel lane for all road functional classifications is 10 feet; this lane width is recommended for this and subsequent alternatives as a traffic-calming feature.

Speed cushions should be implemented in the 10-foot buffer to discourage its use during busier times of the day. This feature intends to prevent using the buffer space as a passing lane when the road is congested while still allowing unobstructed use by emergency vehicles. Likewise, bicyclist safety can be enhanced by installing vertical elements inside the buffer, creating a Separated Bicycle Lane. The vertical elements create greater separation from motor vehicles and discourage using the wide bicycle lane and buffer as a driving/passing lane. However, the recently adopted City of Albuquerque 2024 Bikeway and Trail Facilities Plan guidance indicates that vertical separation may not be appropriate for Lead and Coal with frequent access points such as intersections, alleyways, and driveways.

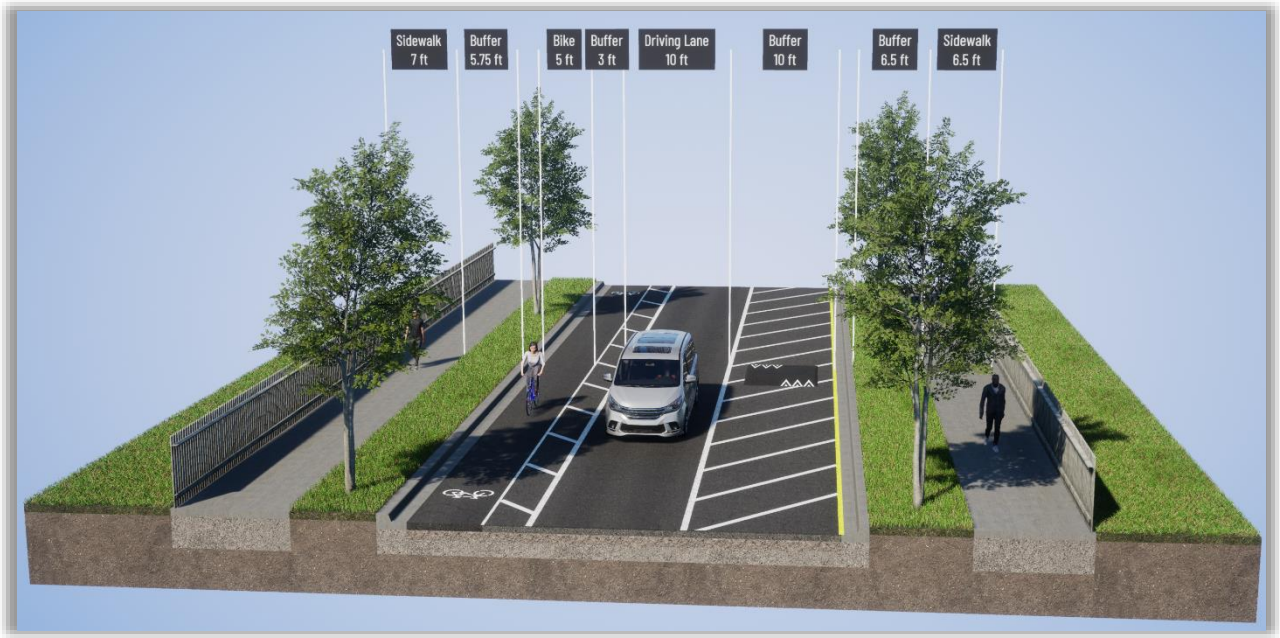

Figure 21: Typical Section Concept for Single-Lane Operation

Two analyses were completed for the single-lane configuration. The first analysis comprises a single lane from Broadway Boulevard to Washington Street. The second analysis is the existing configuration from Broadway Boulevard to Yale Boulevard and then the single-lane configuration from Yale Boulevard to Washington Street.

Two-Way Operation

Two-way operations along the Lead and Coal corridors require reconfiguring the roadway to allow bidirectional travel. This alternative will require additional traffic signal mast arms, signage, and new striping. A typical section for this configuration could include a buffered 5-foot bicycle lane with a 3-foot buffer and two 10-foot driving lanes. The typical section is shown in Figure 22.

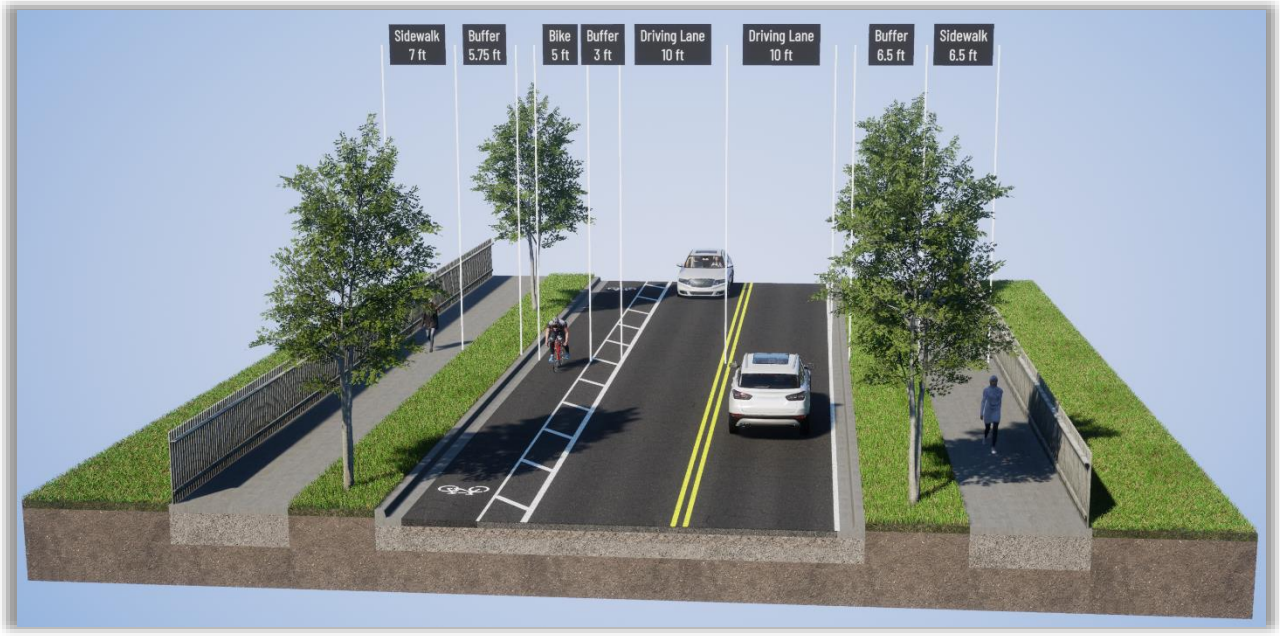

Figure 22: Two-Way Operation Configuration

ORIGIN AND DESTINATION ANALYSIS

An origin and destination analysis aims to review existing traffic data and identify travel patterns from select locations. This study selected three locations along the Lead Avenue and Coal Avenue corridors to determine if they are being used to travel past the corridors' extent. This analysis concluded that most drivers historically began and ended their trips within the study area.

TRAFFIC DIVERSION

As conditions change along the Lead and Coal corridors, some drivers may avoid certain areas and divert to nearby corridors. A diverted vehicle is defined as a vehicle that alters its travel path based on conditions it encounters. Specific to this analysis, a vehicle will divert from its original path when encountering longer-than-expected travel times. This can result from roadway and signal configuration, crashes, or events. Initially, the Lomas Boulevard, Central Avenue, Garfield Boulevard, and Gibson Boulevard corridors were considered for diversion. However, based on the origin and destination analysis, it was determined that drivers were likely to divert to Central Avenue and Garfield Boulevard.

Two-Way Operation Alternative

The Two-Way Operation alternative is not expected to divert traffic; therefore, no diversion proportions were applied to the scenario.

Speed Reduction Alternative

The following diversion proportions are shown in Figure 23 and were used for the Speed Reduction alternative. The minor traffic diversion proportions were used in the Speed Reduction alternative analysis. The Speed Reduction alternative is expected to incur minimal impacts, which is why a minor diversion was assessed.

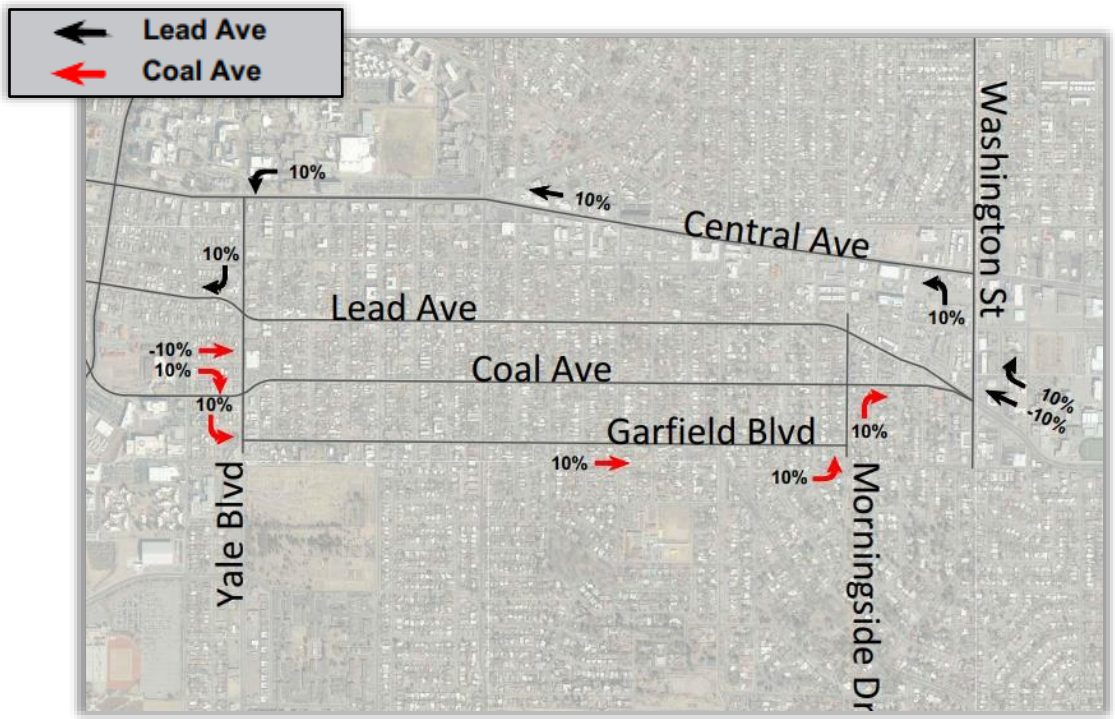

Figure 23: Speed Reduction Minor Traffic Diversion

Single-Lane Operation Alternative

The following diversion proportions are shown in Figure 24 and were used for the Single-Lane Operation alternative analysis. The minor traffic diversion proportions were also used in this analysis.

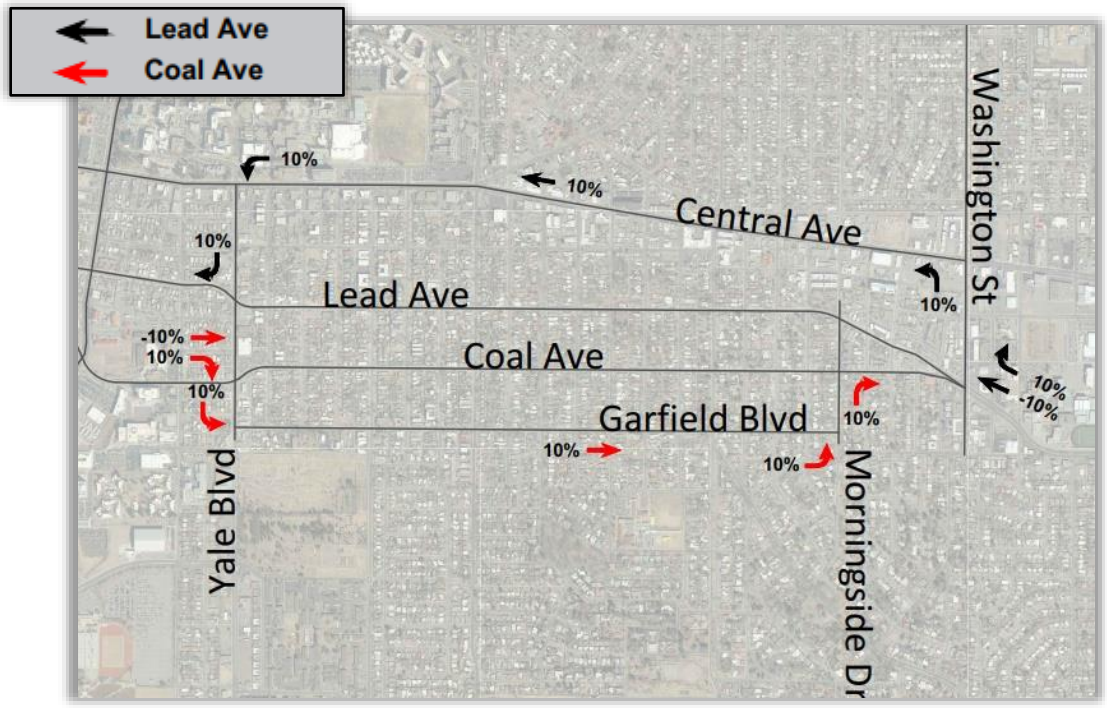

Figure 24: Single-Lane Operation Minor Traffic Diversion

However, the delay anticipated by the original diversion percentages was significant enough to consider additional diversion percentages in this analysis. Therefore, Lee Engineering applied additional proportions to other travel paths. The additional diversion includes traffic shifted in the I-25 to Yale Boulevard and Yale Boulevard to Washington Street sections. Figure 25 depicts the additional diversion.

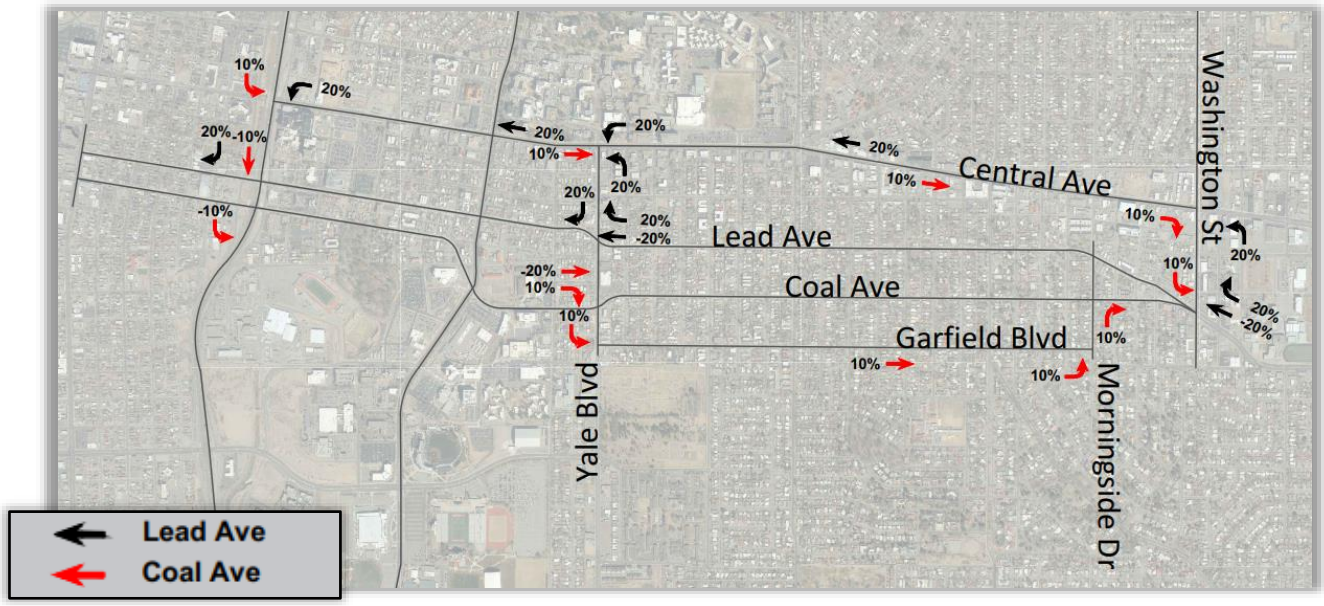

Figure 25: Additional Diversion for Single-Lane Operation

TRAFFIC ANALYSIS

The Synchro 12 analysis software was used to analyze the study intersections for Level of Service (LOS) and 95th percentile queueing conditions. Synchro 12 implements methods and procedures detailed by the Highway Capacity Manual (HCM). Detailed capacity output sheets showing all individual movements can be found in Appendix E.

MOTOR VEHICLE LOS, CAPACITY, AND QUEUING ANALYSIS

Per the HCM, LOS is presented as a letter grade (A through F) based on the calculated average delay for an intersection or movement. Delay is calculated as a function of several variables, including signal phasing operations, cycle length, traffic volumes, and opposing traffic volumes. Still, it measures the average wait time a driver can expect when moving through an intersection. Factors such as total cycle time (for all movements), queueing restrictions, and vehicle volumes can affect delay measurements, especially for lower-volume movements and side streets. Generally, these factors are only realized when delays reach or exceed LOS E thresholds. In such cases, subsequent sections offer a narrative specific to the individual movement in question. Traffic counts are in Appendix C. Complete HCM Results Summary Reports are in Appendix E.

Signal timing provided by the City of Albuquerque was used for analysis. The Rest-in-Red operations occur during off-peak hours. This study analyzed peak hour periods; therefore, the Rest-in-Red operations did not affect the analysis.

Table 17 and Table 18 The HCM reproduces delay thresholds and the associated Level of service assigned to delay ranges for signalized intersections and stop-controlled intersections, respectively. Generally, an LOS of D or better is considered an acceptable level of service.

Table 17: LOS Criteria and Descriptions for Signalized Intersections

Level of Service	Average Control Delay (sec/vehicle)	General Description (Signalized Intersections)
A	≤10	Free flow
B	>10 – 20	Stable flow (slight delays)
C	>20 – 35	Stable flow (acceptable delays)
D	>35 – 55	Approaching unstable flow (tolerable delay, occasionally wait through more than one signal cycle before proceeding)
E	>55 – 80	Unstable flow (intolerable delay)
F	>80	Forced flow (jammed)

Table 18: LOS Criteria for Unsignalized Intersections

Level of service	Average Control Delay (sec/vehicle)
A	≤10
B	>10 – 15
C	>15 – 25
D	>25 – 35
E	>35 – 50
F	>50

Queueing is reported in feet for all intersections with queue lengths greater than one vehicle, with a base assumption of 25 feet queue length per vehicle. Queues are reported for queue measurements falling within the 95th percentile. Notably, 95th percentile queues are statistically expected to occur during only 5% of the peak hour's sign cycles. It is also noted that unreported average queueing at an intersection would statistically be much shorter than 95th-percentile queueing.

The volume-to-capacity (V/C) ratio is a performance measure showing the traffic volume ratio to the lane group capacity. A V/C ratio greater than 1.00 indicates that demand creates a residual queue for the analysis period.

For this analysis, acceptable levels of service (LOS) are defined as a LOS D or better. Based on procedures outlined in the HCM, intersection delay and level of service for stop-controlled intersections are reported as the delay and level of service for the worst-case movement at each intersection. For all other control types, they are taken for the whole intersection. Detailed output sheets can be found in Appendix E.

Existing Year 2024 AM and PM Conditions

LOS

Existing year conditions include the existing lane configurations, intersection signal timing, and volumes along the corridors. Figure 26 and Figure 27 These figures show the intersection LOS for each intersection's AM and PM peak hours. The intersections operate at acceptable LOS during AM and PM peak hours.

Figure 26: Vehicle LOS – Existing AM

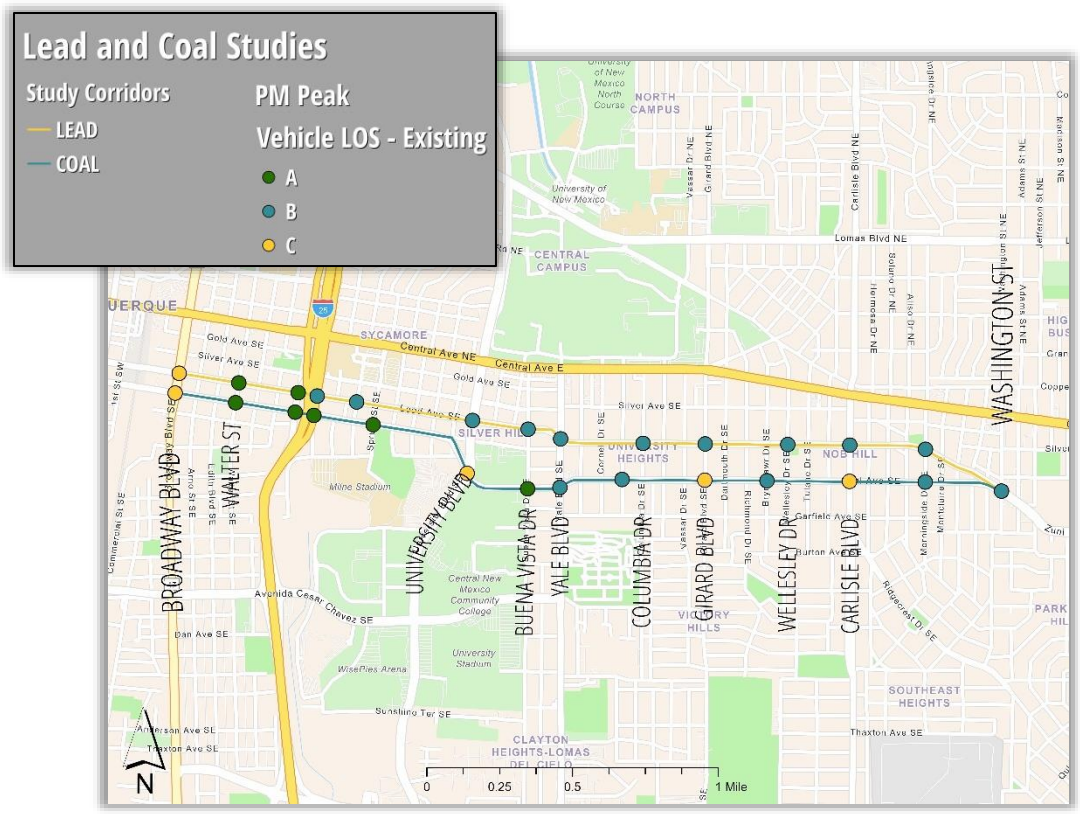

Figure 27: Vehicle LOS - Existing PM

Queueing

Queueing at each intersection was also assessed. The expected 95th percentile queue in the east and west directions was compared with the distance to the next cross street. Figure 28 and Figure 29 detail whether the 95th percentile queue is expected to exceed the distance to the next cross street. From these figures, it can be concluded that the 95th percentile queue lengths are not currently exceeding the distance to the next cross street.

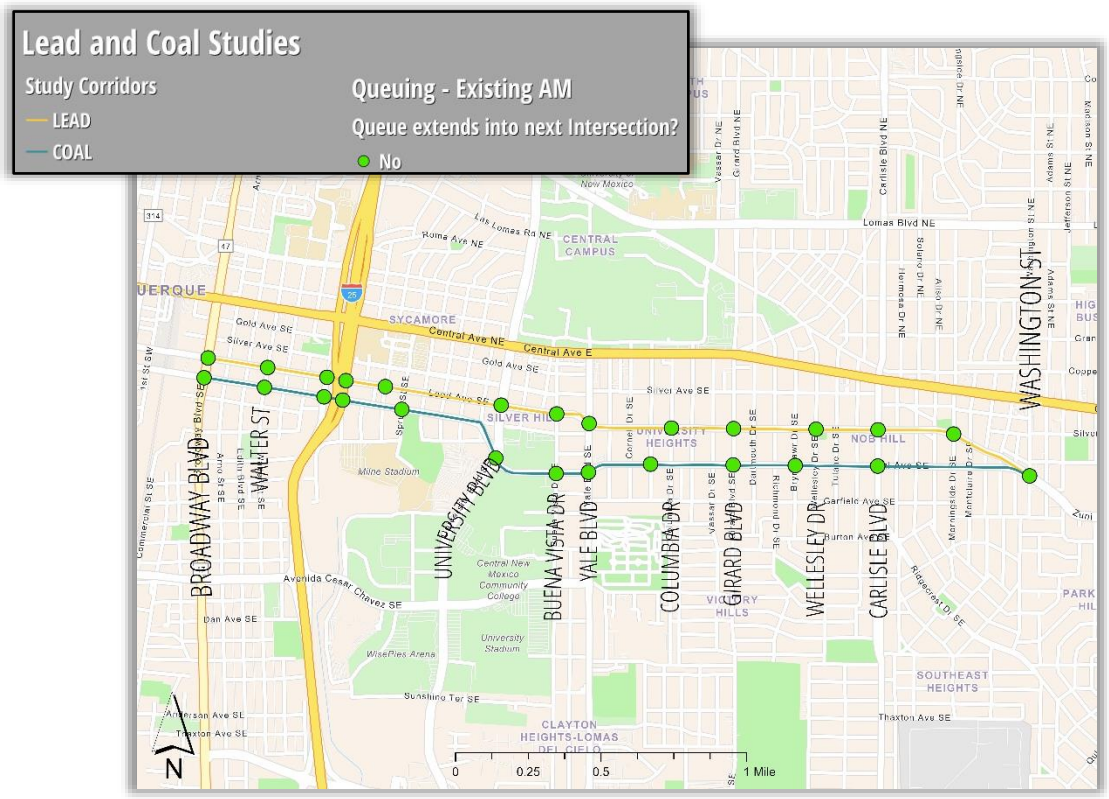

Figure 28: Queueing Results - Existing AM

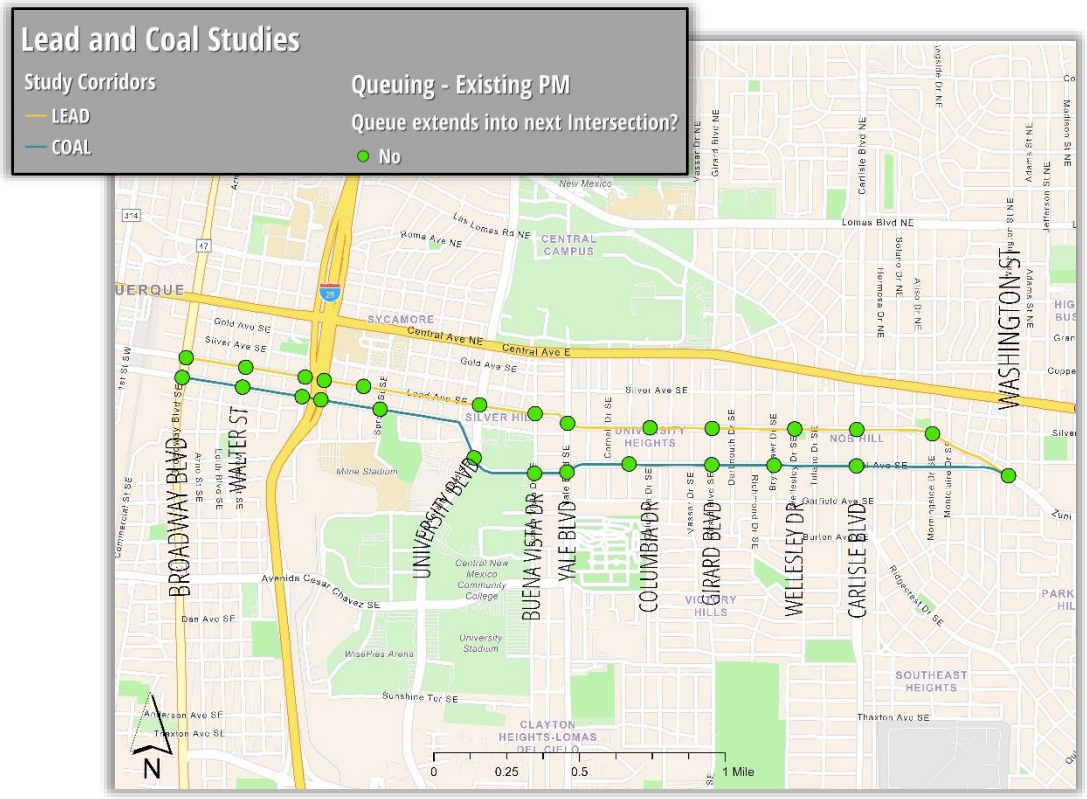

Figure 29: Queueing Results - Existing PM

Speed Reduction AM and PM Conditions

LOS

Speed reduction conditions include the existing lane configurations, existing intersection signal timing with offsets optimized for 25 MPH, and diverted volumes along the corridors analyzed with a 25 MPH speed limit. Figure 30 and Figure 31 show the intersection LOS for each intersection. These figures show that the intersections are expected to operate at acceptable LOS in the AM and PM peak hours under the Speed Reduction scenario.

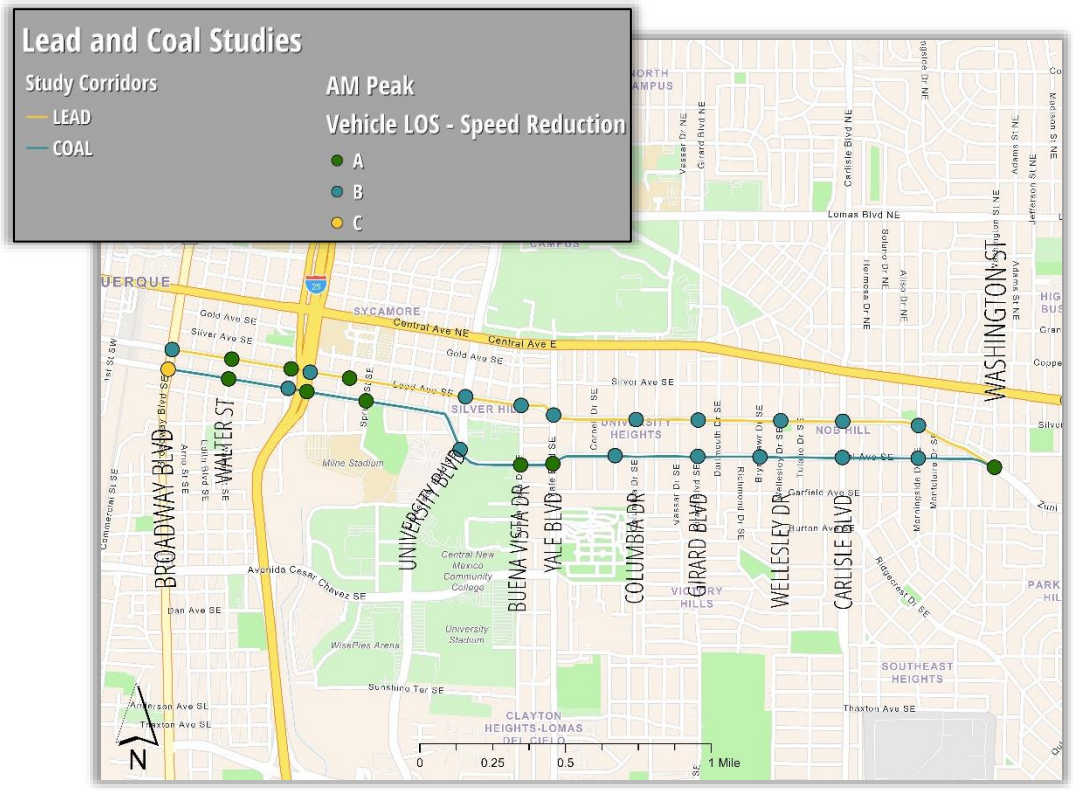

Figure 30: Vehicle LOS – Speed Reduction AM

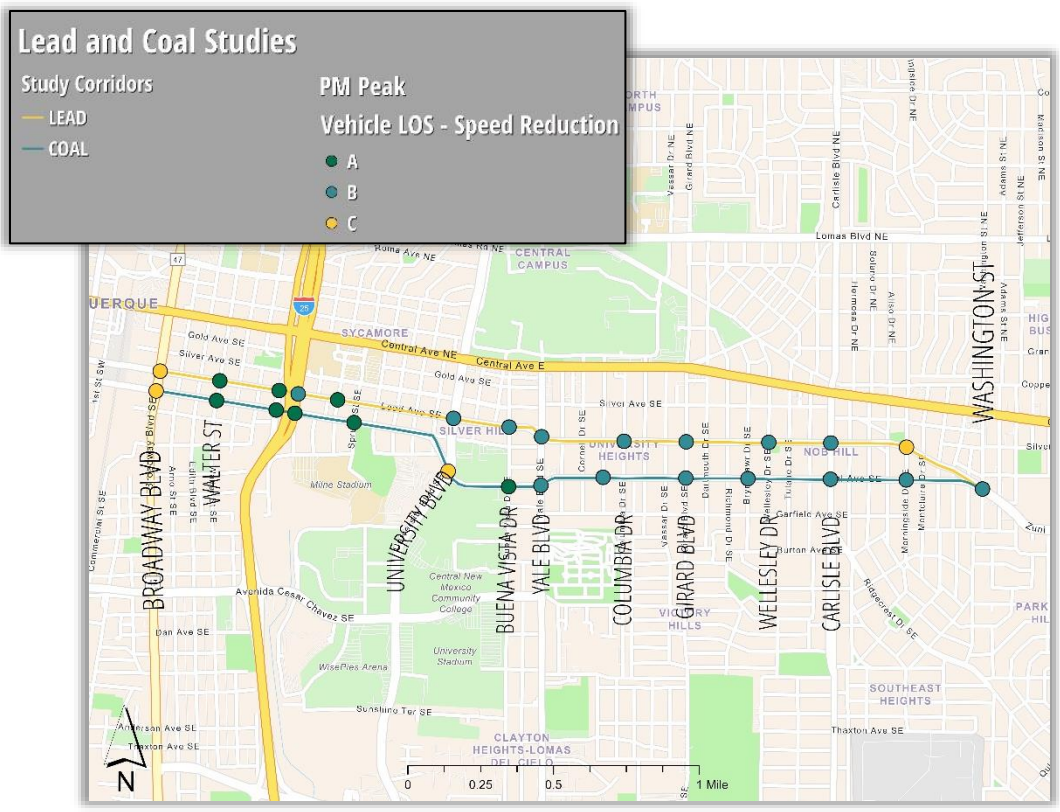

Figure 31: Vehicle LOS – Speed Reduction PM

Queuing

Queueing at each intersection was also assessed. The expected 95th percentile queue in the east and west directions was compared with the distance to the next cross street. Figure 32 and Figure 33 detail whether the 95th percentile queue is expected to exceed the distance to the next cross street. From these figures, it can be concluded that the 95th percentile queue lengths are not expected to exceed the distance to the next cross street under the Speed Reduction scenario except for the intersection of Lead Avenue and Morningside Drive.

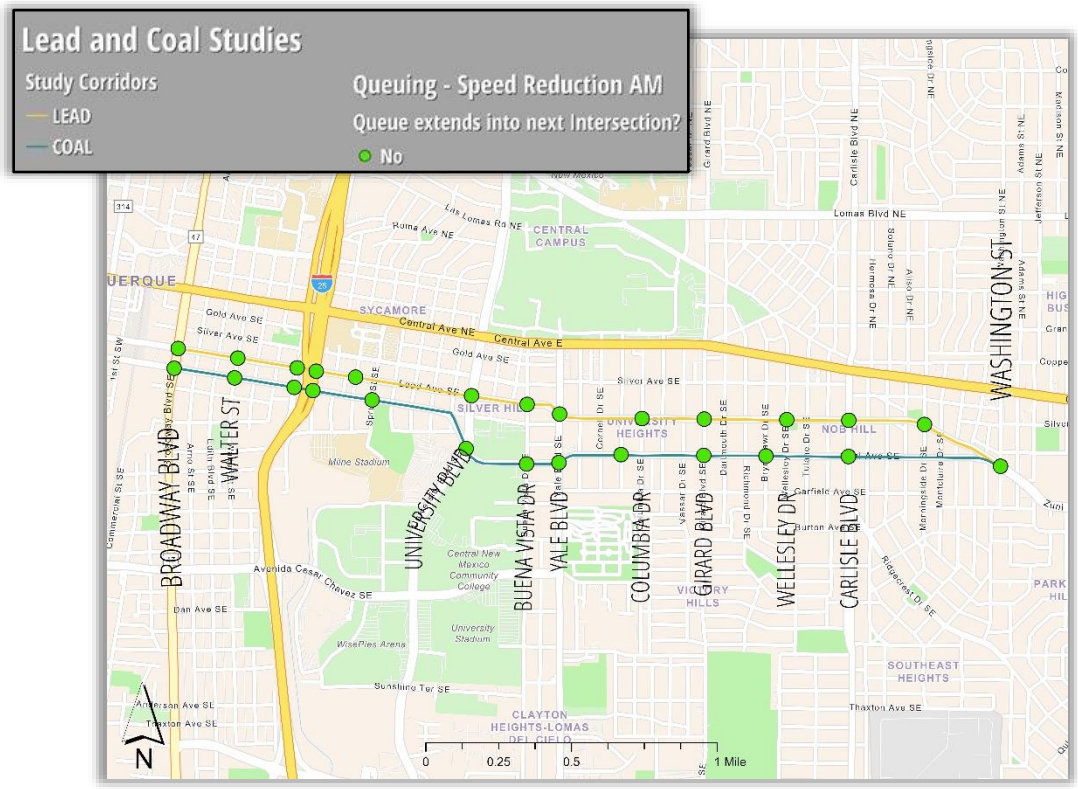

Figure 32: Queueing Results - Speed Reduction AM

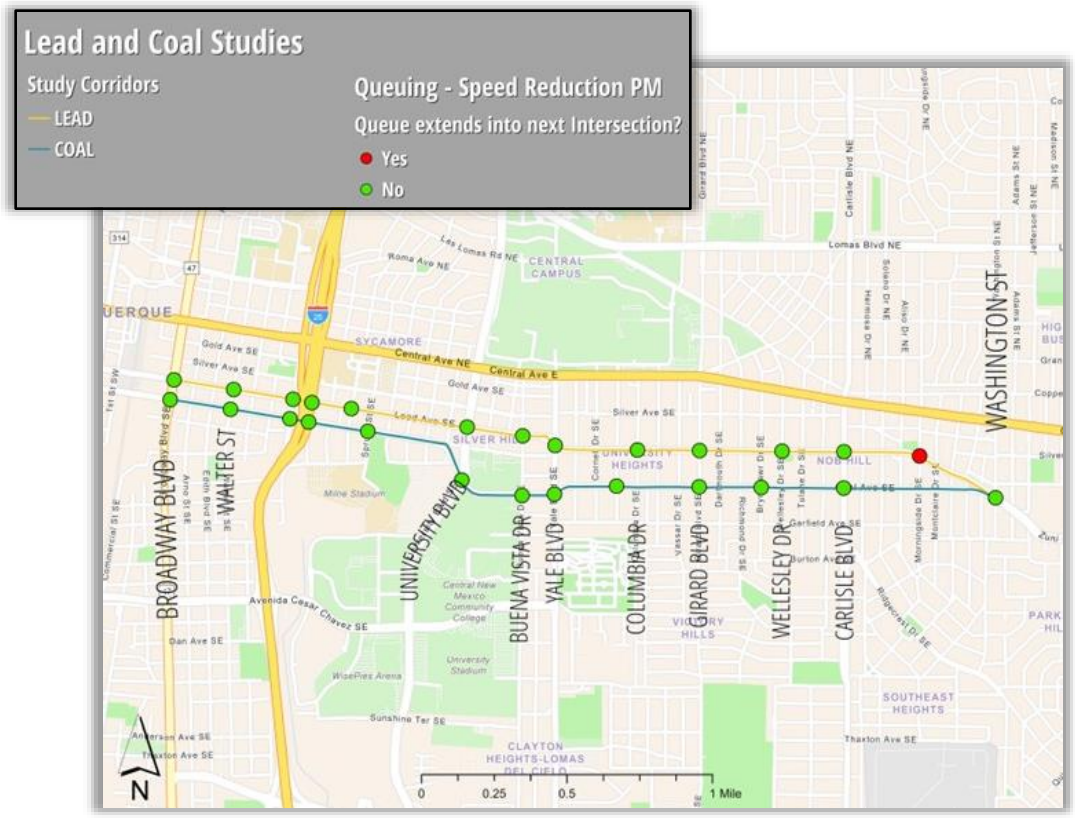

Figure 33: Queueing Results – Speed Reduction PM

Single-Lane Operation AM and PM Conditions

Single-lane operation conditions include single-lane configurations, existing intersection signal timing, and diverted volumes. Figure 34 and Figure 35 show the intersection LOS for each intersection. These figures show that the intersections are expected to operate at acceptable LOS in both the AM and PM peak hours under the Speed Reduction scenario, except for the intersection of Coal Avenue and University Boulevard in the PM peak hour.

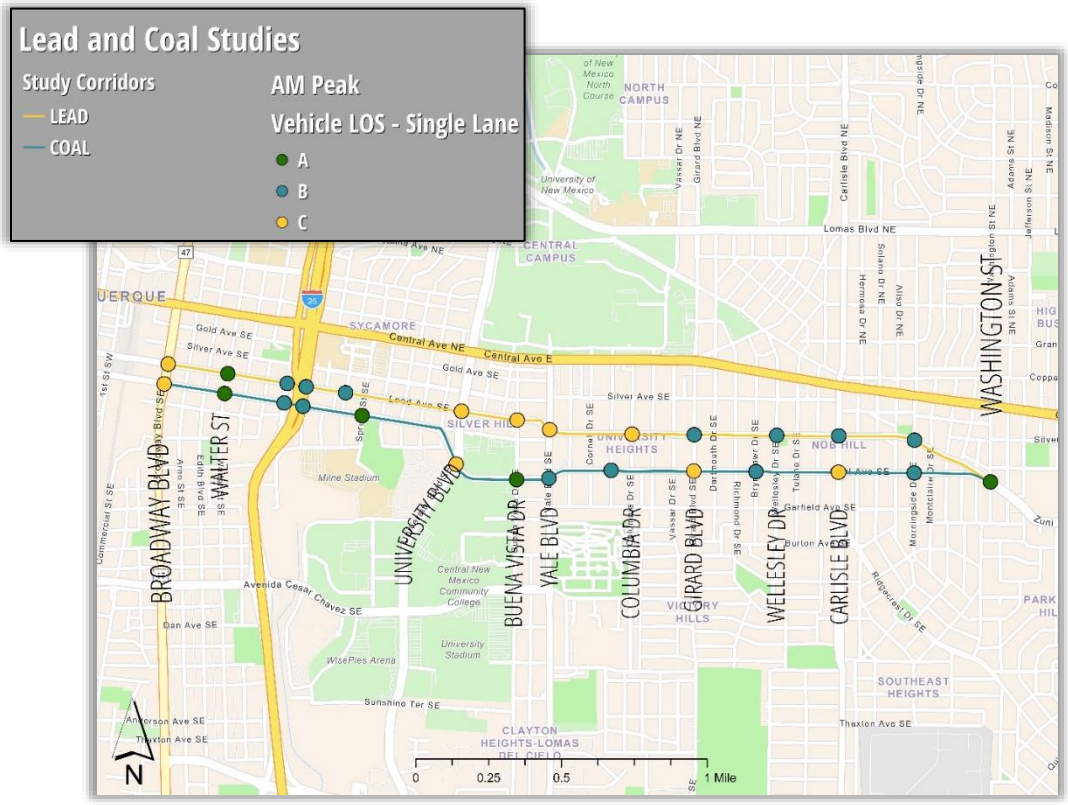

Figure 34: Vehicle LOS – Single-Lane Operation AM

Figure 35: Vehicle LOS – Single-Lane Operation PM

Queueing

Queueing at each intersection was also assessed. The expected 95th percentile queue in the east and west directions was compared with the distance to the next cross street. Figure 36 and Figure 37 detail whether the 95th percentile queue is expected to exceed the distance to the next cross street. From these figures, it can be concluded that the 95th percentile queue lengths are expected to exceed the distance to the next cross street under the Single-Lane Operation scenario except for the following intersections:

- Lead Avenue and Broadway Boulevard in the AM and PM
- Lead Avenue and Walter Street in the AM and PM
- Lead Avenue and University Boulevard in the AM and PM
- Lead Avenue and Buena Vista Drive in the AM and PM
- Lead Avenue and Columbia Drive in the AM and PM
- Lead Avenue and Girard Boulevard in the PM
- Lead Avenue and Wellesley Drive in the PM
- Lead Avenue and Carlisle Boulevard in the PM
- Lead Avenue and Morningside Drive in the PM
- Coal Avenue and Locust Street in the AM and PM
- Coal Avenue and Oak Street in the AM
- Coal Avenue and Stanford Drive in the PM
- Coal Avenue and Girard Boulevard in the PM
- Coal Avenue and Bryn Mawr Drive in the PM
- Coal Avenue and Carlisle Boulevard in the PM

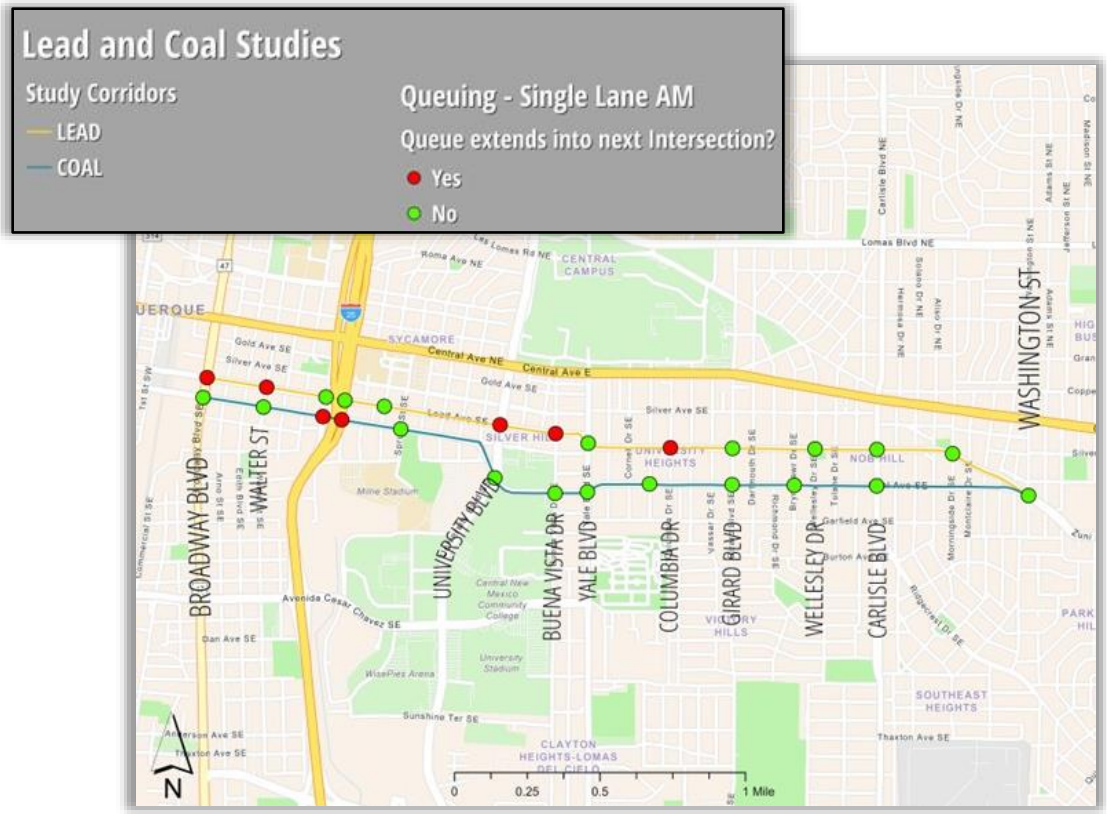

Figure 36: Queueing Results – Single-Lane Operation AM

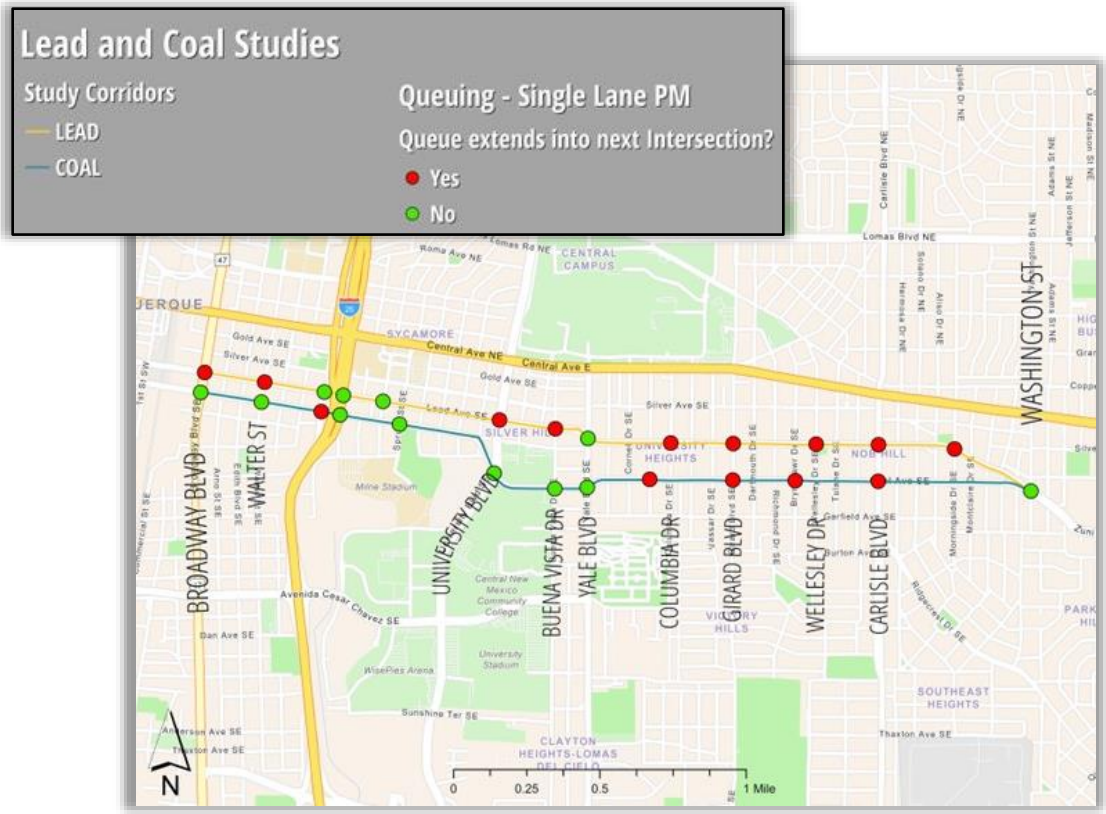

Figure 37: Queueing Results – Single-Lane Operation PM

Single-Lane Operation with Additional Diversion AM and PM Conditions

The delay anticipated by the original diversion percentages was significant enough to consider additional diversion percentages in this analysis. Single-lane operation with additional diversion conditions includes single-lane configurations, existing intersection signal timing, and diverted volumes. Figure 38 and Figure 39 show the intersection LOS for each intersection. From these figures, it can be concluded that the intersections are expected to operate at acceptable LOS in both the AM and PM peak hours under the single-lane operation with additional diversion scenarios except for the intersection of Coal Avenue and University Boulevard in the PM peak hour.

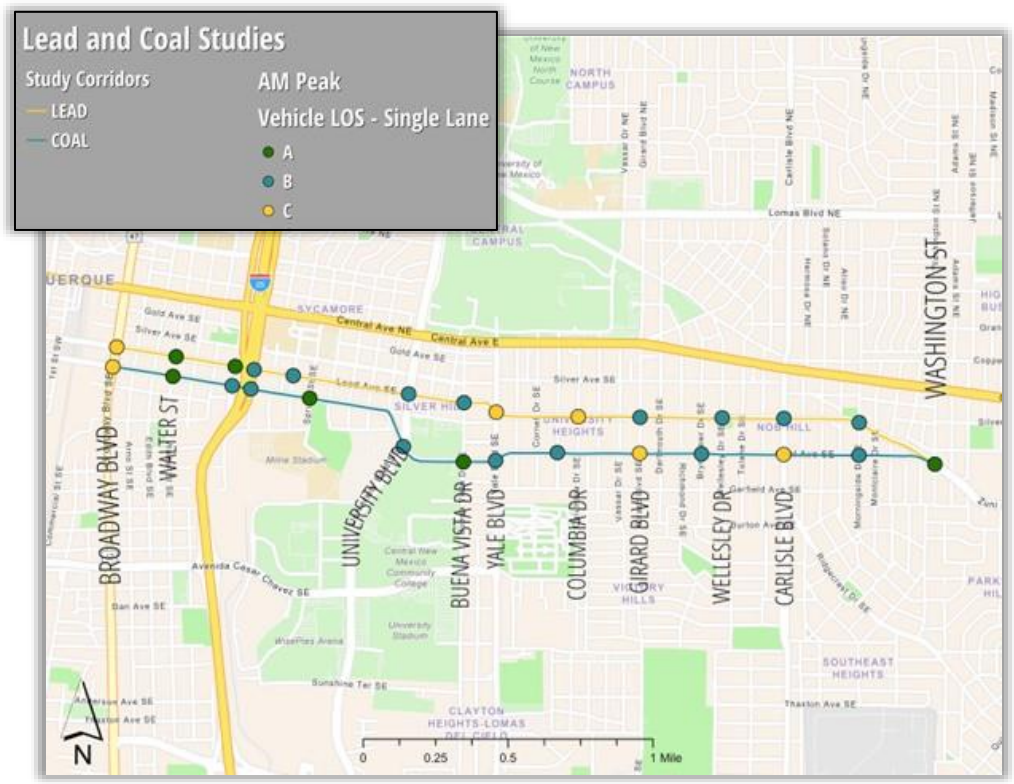

Figure 38: Vehicle LOS – Single-Lane Operation with Additional Diversion AM

Figure 39: Vehicle LOS – Single-Lane Operation with Additional Diversion PM

Queueing

Queueing at each intersection was also assessed. The expected 95th percentile queue in the east and west directions was compared with the distance to the next cross street. Figure 40 and Figure 41 detail whether the 95th percentile queue is expected to exceed the distance to the next cross street. From these figures, it can be concluded that the 95th percentile queue lengths are not expected to exceed the distance to the next cross street under the Single-Lane Operation with Additional Diversion scenario except for the following intersections:

- Lead Avenue and Broadway Boulevard in the AM and PM
- Lead Avenue and Walter Street in the AM and PM
- Lead Avenue and University Boulevard in the AM and PM
- Lead Avenue and Buena Vista Drive in the AM and PM
- Lead Avenue and Columbia Drive in the AM and PM
- Lead Avenue and Girard Boulevard in the PM
- Lead Avenue and Wellesley Drive in the PM
- Lead Avenue and Carlisle Boulevard in the PM
- Lead Avenue and Morningside Drive in the PM
- Coal Avenue and Stanford Drive in the PM
- Coal Avenue and Girard Boulevard in the PM
- Coal Avenue and Bryn Mawr Drive in the PM
- Coal Avenue and Carlisle Boulevard in the PM

Figure 40: Queueing Results – Single-Lane Operation with Additional Diversion AM

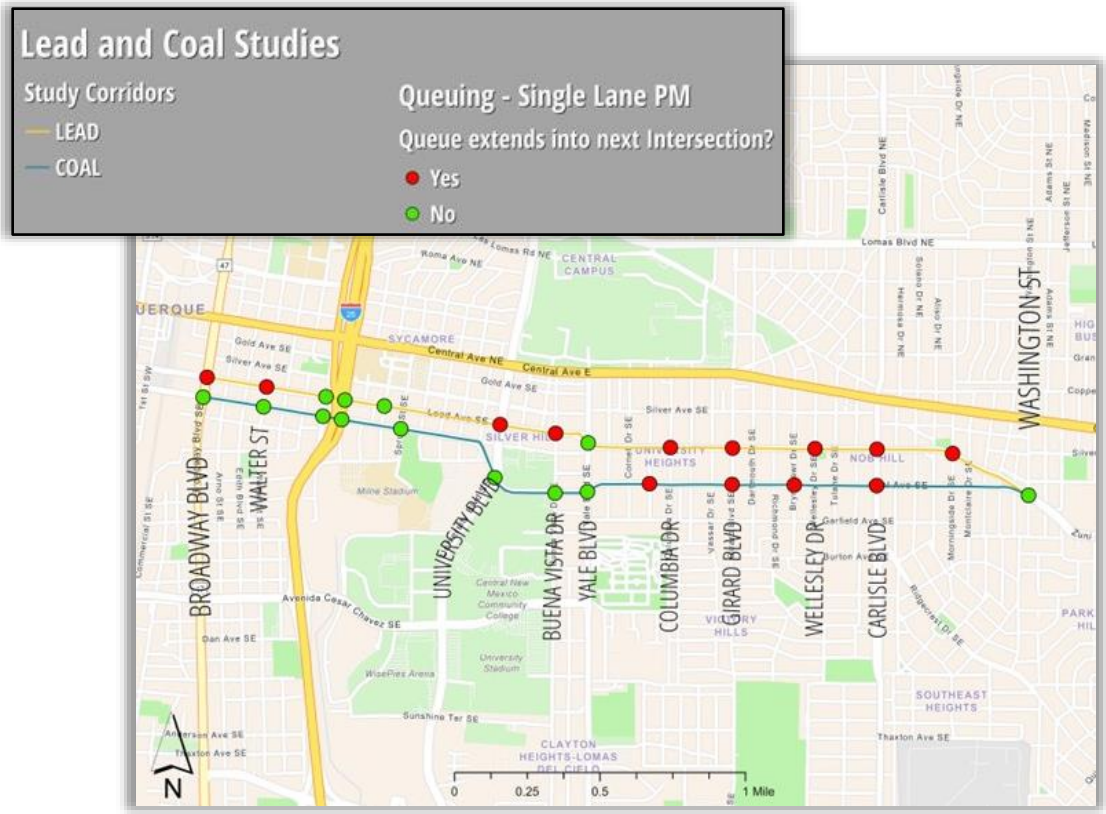

Figure 41: Queueing Results – Single-Lane Operation with Additional Diversion PM

Single-Lane Operation from Yale Boulevard to Washington Street AM and PM Conditions

Single-lane operation from Yale Boulevard to Washington Street conditions include the existing configuration from Broadway Boulevard to Yale Boulevard, intersection signal timing, and diverted volumes. Figure 42 and Figure 43 show the intersection LOS for each intersection. From these figures, it can be concluded that the intersections are expected to operate at acceptable LOS in both the AM and PM peak hours under the Single-Lane Operation from Yale Boulevard to Washington Street scenarios.

Figure 42: Vehicle LOS – Single-Lane Operation from Yale Blvd to Washington St AM

Figure 43: Vehicle LOS – Single-Lane Operation from Yale Blvd to Washington St PM

Queueing

Queueing at each intersection was also assessed. The expected 95th percentile queue in the east and west directions was compared with the distance to the next cross street. Figure 44 and Figure 45 detail whether the 95th percentile queue is expected to exceed the distance to the next cross street. From these figures, it can be concluded that the 95th percentile queue lengths are not expected to exceed the distance to the next cross street under the Single-Lane Operation from Yale Boulevard to Washington Street scenario except for the following intersections:

- Lead Avenue and Columbia Drive in the AM and PM
- Lead Avenue and Girard Boulevard in the PM
- Lead Avenue and Wellesley Drive in the PM
- Lead Avenue and Carlisle Boulevard in the PM
- Lead Avenue and Morningside Drive in the PM
- Coal Avenue and Stanford Drive in the PM
- Coal Avenue and Girard Boulevard in the PM
- Coal Avenue and Bryn Mawr Drive in the PM
- Coal Avenue and Carlisle Boulevard in the PM

Figure 44: Queueing Results – Single-Lane Operation from Yale Blvd to Washington St AM

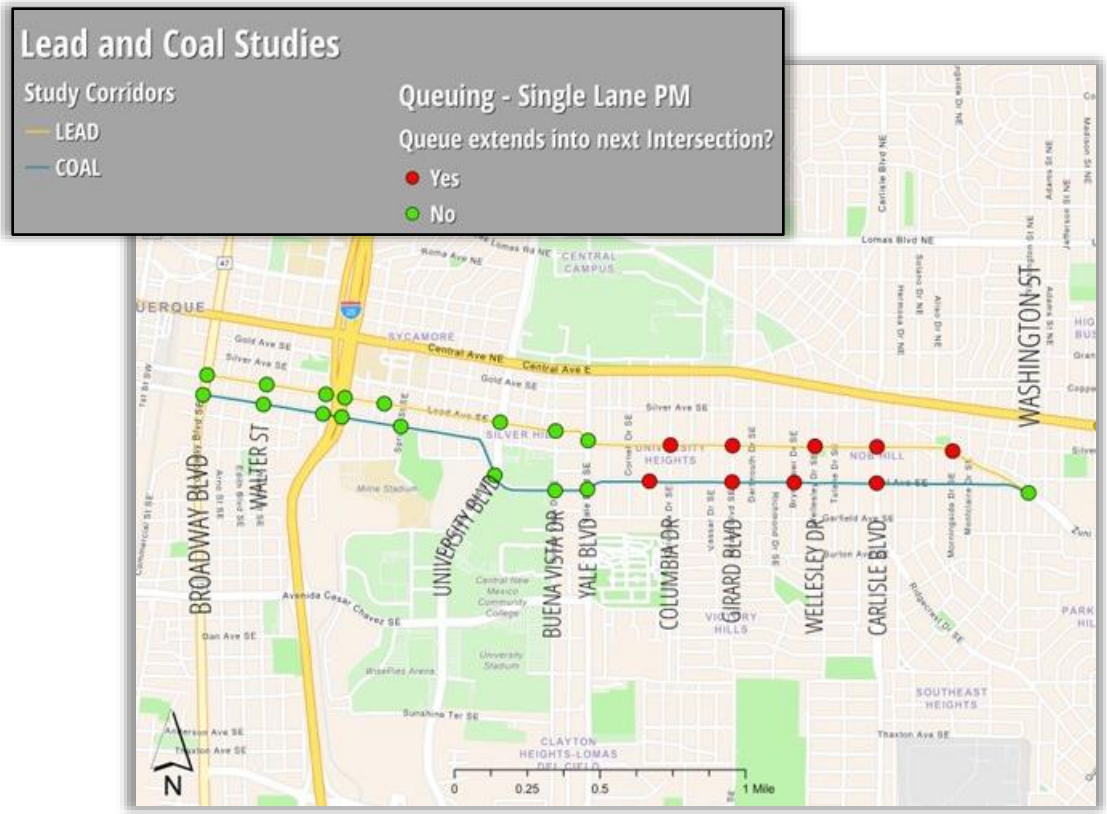

Figure 45: Queueing Results – Single-Lane Operation from Yale Blvd to Washington St PM

Two-way operation AM and PM Conditions

Two-way operation conditions include bidirectional lane configurations, existing intersection signal timing, and existing volumes. Figure 46 and Figure 47 show the intersection LOS for each intersection. From these figures, it can be concluded that the intersections are expected to operate at acceptable LOS in both the AM and PM peak hours under the Two-Way Operation scenario except for the following intersections:

- Lead Avenue and University Boulevard in the PM
- Coal Avenue and University Boulevard in the PM

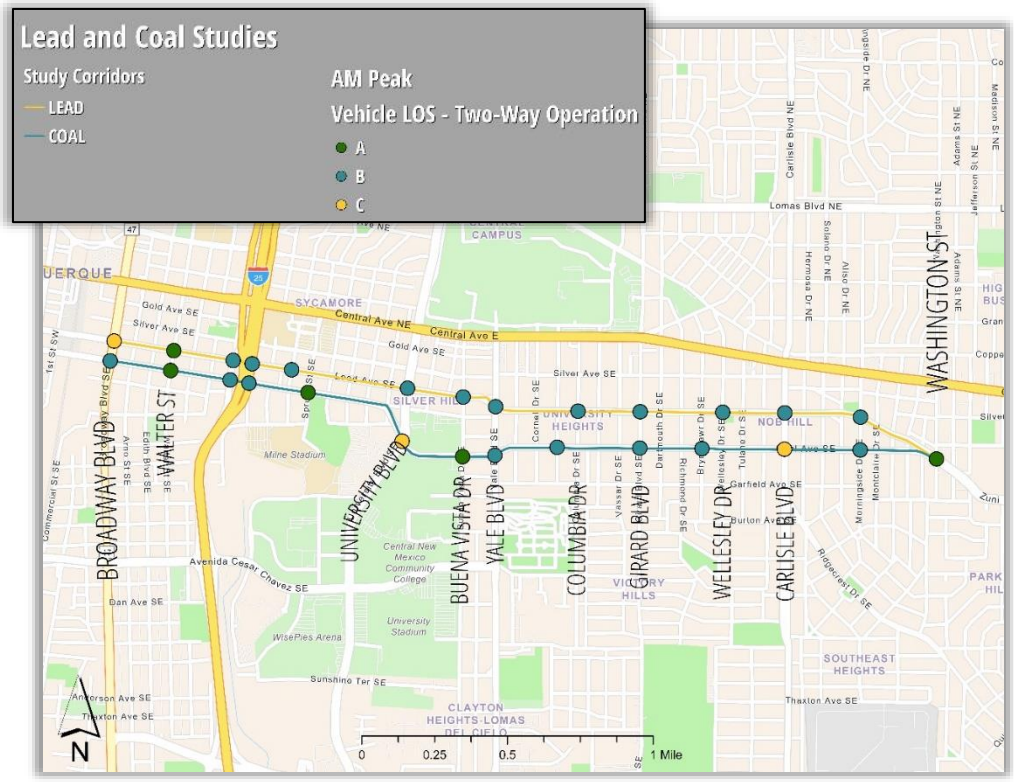

Figure 46: Vehicle LOS - Two-Way Operation AM

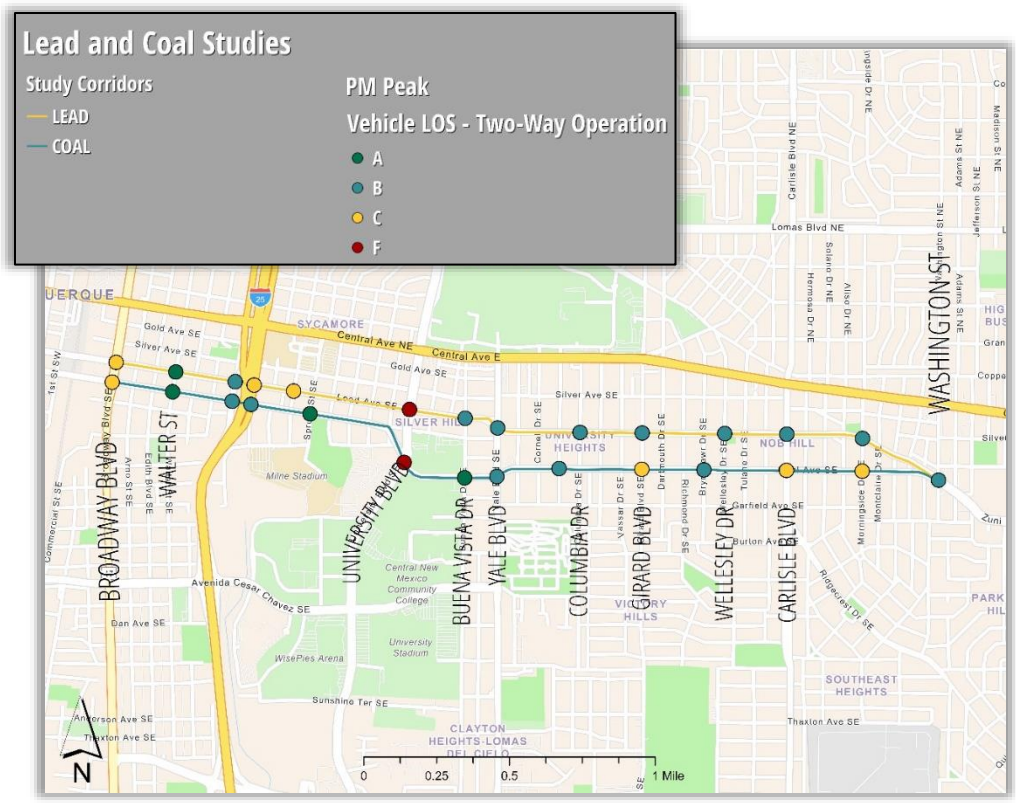

Figure 47: Vehicle LOS - Two-Way Operation PM

Queuing

Queueing at each intersection was also assessed. The expected 95th percentile queue in the east and west directions was compared with the distance to the next cross street. Figure 48 and Figure 49 detail whether the 95th percentile queue is expected to exceed the distance to the next cross street. From these figures, it can be concluded that the 95th percentile queue lengths are not expected to exceed the distance to the next cross street under the Two-Way Operation scenario except for the following intersections:

- Lead Avenue and Oak Street in the PM
- Lead Avenue and University Boulevard in the PM

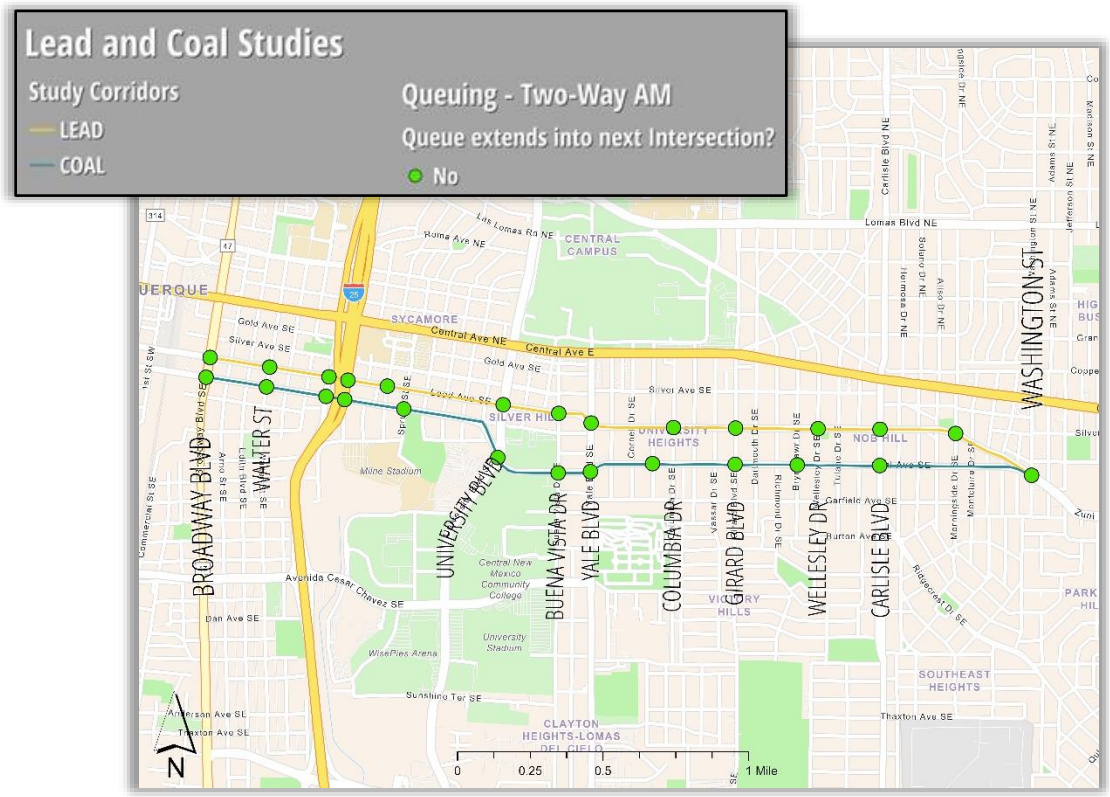

Figure 48: Queueing Results – Two-Way Operation AM

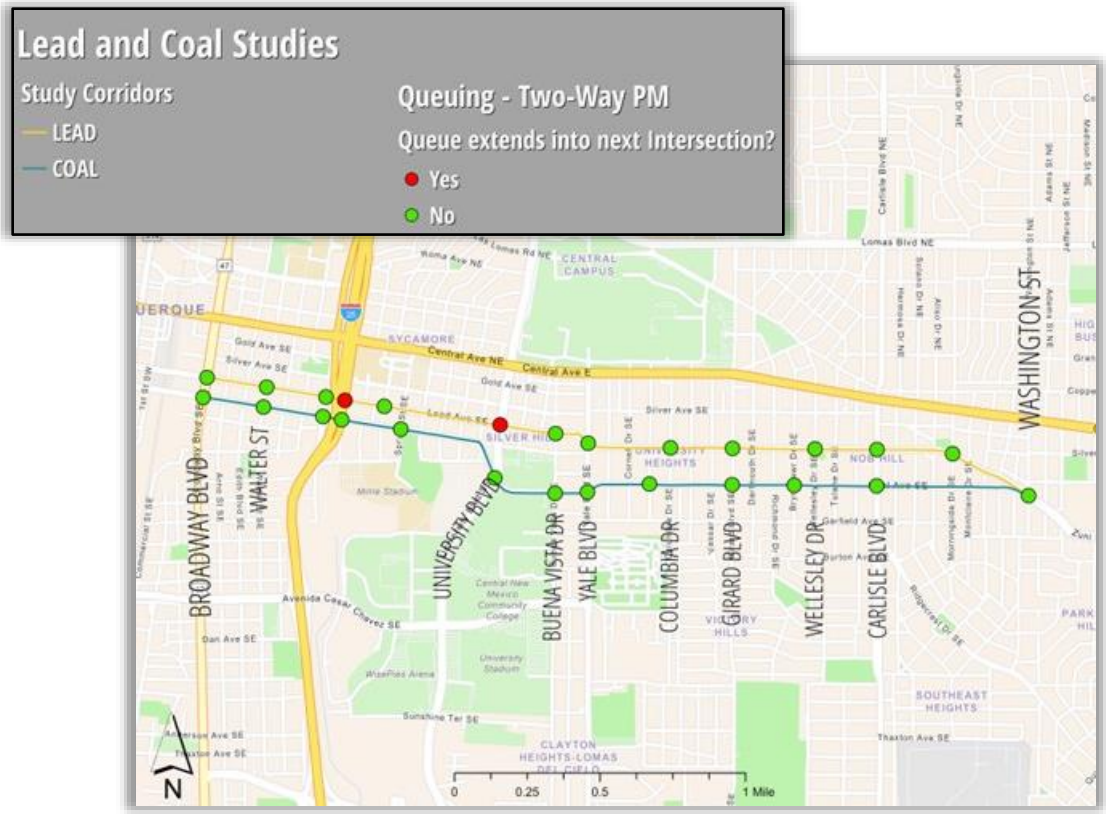

Figure 49: Queueing Results - Two-Way Operation PM

PEDESTRIAN LOS

Pedestrian LOS is a quantitative tool used to assess a pedestrian's time to traverse an intersection. The Synchro software used in the traffic analysis assesses Pedestrian LOS based on the signal timing and coordination plans. This analysis reviews Pedestrian LOS by intersection. Figure 50 and Figure 51 show the Pedestrian LOS by intersection. From these figures, it can be concluded that the intersections are expected to operate at acceptable Pedestrian LOS in both the AM and PM peak hours under the Speed Reduction scenario.

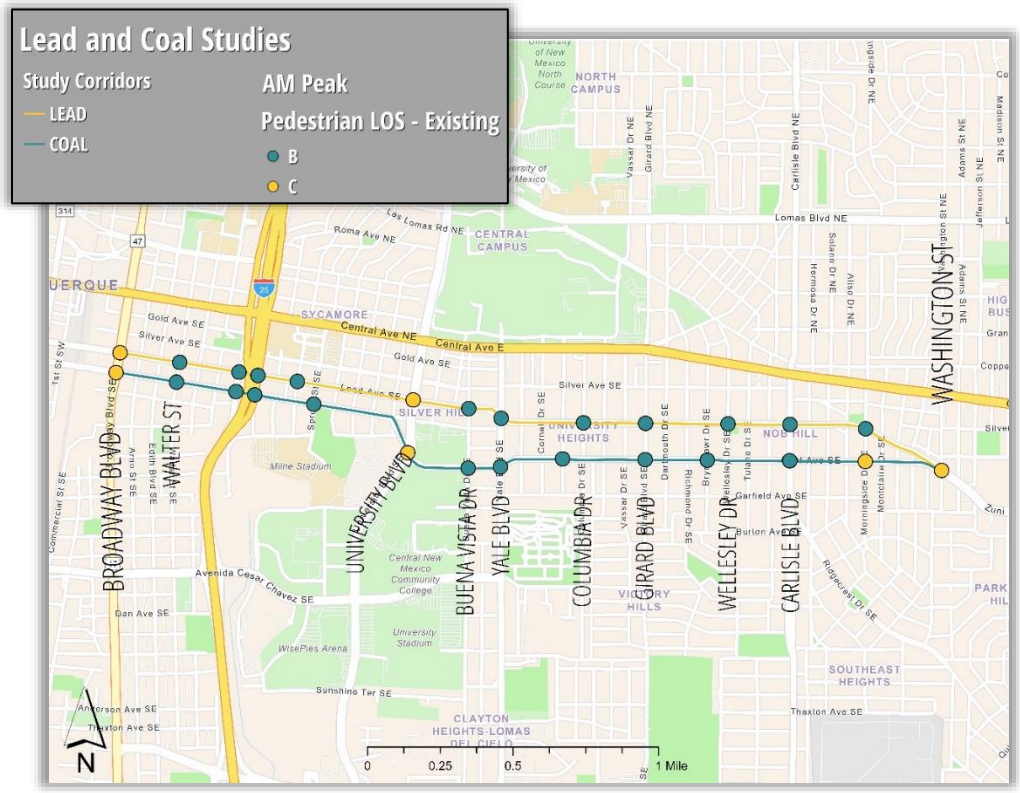

Figure 50: Pedestrian LOS - Existing AM

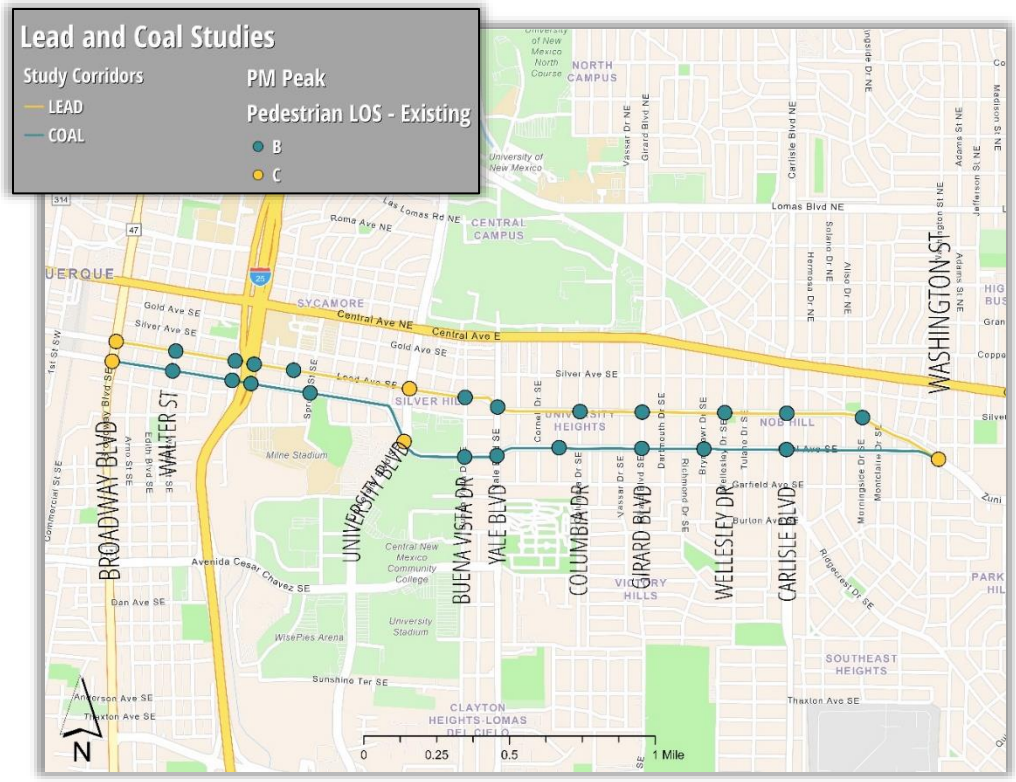

Figure 51: Pedestrian LOS - Existing PM

Pedestrian Level of Traffic Stress (PLTS)

PLTS is a qualitative tool to evaluate how comfortable, safe, and accessible a pedestrian facility feels based on motor vehicle traffic volume (AADT), traffic speed (85th Percentile), sidewalk width, buffer width, the space between motor vehicles and pedestrian facility, i.e., paved shoulder width, bicycle lane, and landscaping buffer. It aids in evaluating pedestrian facilities based on stress-inducing factors rather than operational attributes, such as a quantitative measure of pedestrian LOS. PLTS uses a tiered system (1-4) to rate facilities. The tiers are described as:

- PLTS 1: Little to no stress. Users may include children and elderly individuals.
- PLTS 2: Low stress for most adults but may prove too stressful for some
- PLTS 3: Moderate to high stress discourages walking for many people
- PLTS 4: High stress, not suitable for most users

PLTS is used because it focuses on factors that make walking uncomfortable or unsafe, while PLOS evaluates how efficiently pedestrian facilities function. Figure 52 is the table for road segments with sidewalks and traffic volumes over 7,500 Average Annual Daily Traffic (AADT). The project team used an 85th percentile speed of 33 MPH for the 25 MPH alternative evaluation and 38 MPH for the others. These values are determined from the data collection efforts' worst-case scenario 85th percentile speeds. The green box indicates the portion of the table used to evaluate the Lead and Coal corridors.

		Buffer Width			
Speed	**Sidewalk Width**	> 10ft	5ft to 9ft	1ft to 4ft	None
≤ 20 mph	> 10ft	1	1	2	2
	8ft to 10ft	1	2	2	3
	5ft to 7ft	2	2	3	4
	<5ft	3	3	4	4
21-25mph	> 10ft	1	1	2	2
	8ft to 10ft	1	2	3	3
	5ft to 7ft	2	3	3	4
	<5ft	3	4	4	4
26-30mph	> 10ft	1	1	2	3
	8ft to 10ft	1	2	2	3
	5ft to 7ft	2	3	3	4
	<5ft	3	4	4	4
31-35mph	> 10ft	1	2	3	3
	8ft to 10ft	2	3	3	4
	5ft to 7ft	3	3	4	4
	<5ft	4	4	4	4
> 35mph	> 10ft	2	2	3	3
	8ft to 10ft	2	3	3	4
	5ft to 7ft	3	4	4	4
	<5ft	4	4	4	4

Figure 52: PLTS for Segments with Sidewalks and AADT >7,500

Existing and Speed Reduction PLTS

The PLTS for the Existing conditions are the same for the Speed Reduction alternative since no roadway changes occur when lowering the speed limit. The projected team took a conservative approach to driver behavior when presented with a lower speed limit. In many cases, reducing the speed limit by changing signs does little to impact motor vehicle speeds without active enforcement and roadway changes. Under these conditions, most of the corridor is PLTS 4 and only improves slightly to PLTS 3 in a few areas. Figure 53 shows the PLTS evaluation under Existing and Speed Reduction conditions.

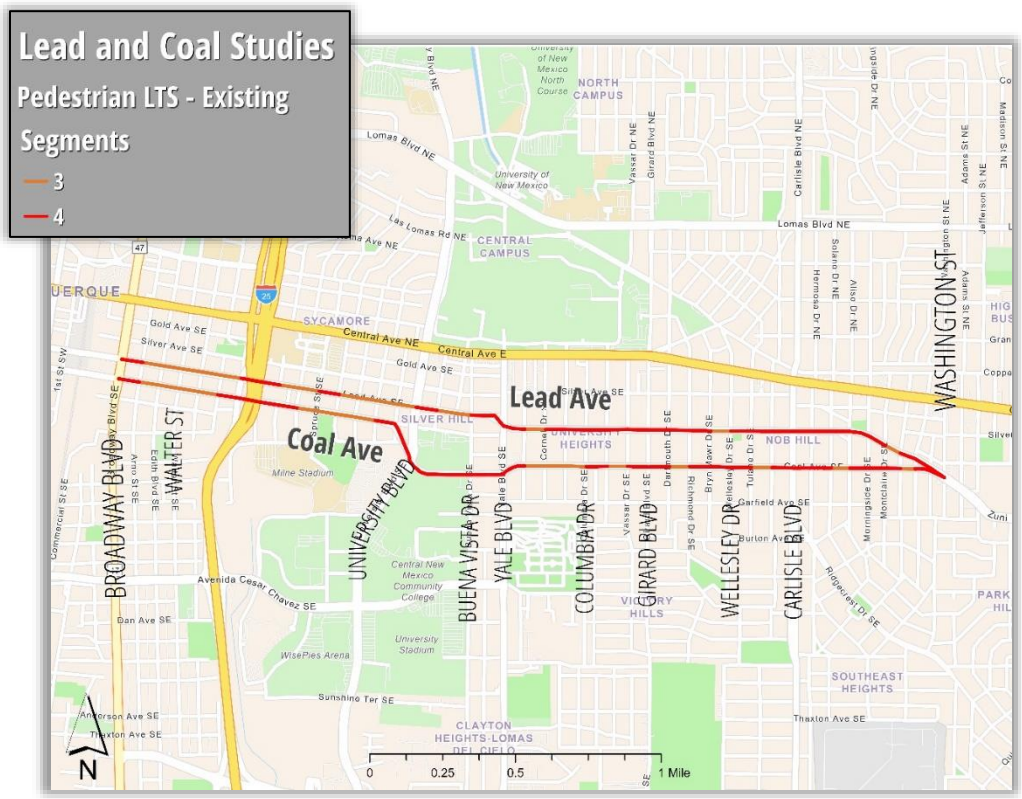

Figure 53: Pedestrian LTS – Existing and Speed Reduction

Single-Lane PLTS

The PLTS evaluation for the Single-Lane condition shows PLTS improvements corridor-wide, but most prominently in the residential area from Buena Vista Drive to Morningside Drive and Broadway Boulevard to University Boulevard. Under these conditions, most of the corridor is PLTS 3, with some areas improving to PLTS 2 and only PLTS 4 in a few places. Figure 54 shows the PLTS evaluation under Existing and Speed Reduction conditions.

Figure 54: Pedestrian LTS – Single-Lane

Two-Way PLTS

The PLTS evaluation for the Two-way operation shows PLTS, with more areas indicating PLTS 4 and only one area indicating PLTS 2. Compared to the single-lane condition, the remaining segments are at PLTS 3. However, it is still an improvement compared to the Existing and Speed Reduction conditions. Figure 55 shows the PLTS evaluation under Two-way operations.

Figure 55: Pedestrian LTS - Two-Way

BICYCLE LOS

Bicycle LOS is a quantitative tool used to assess a cyclist's time to traverse an intersection. The Synchro software used in the traffic analysis assesses Bicycle LOS based on the signal timing and coordination plans. This analysis reviews Bicycle LOS by intersection. Figure 56 and Figure 57 show the Bicycle LOS by intersection. From these figures, it can be concluded that the intersections are expected to operate at acceptable Bicycle LOS in both the AM and PM peak hours under the Speed Reduction scenario.

Figure 56: Bicycle LOS - Existing AM

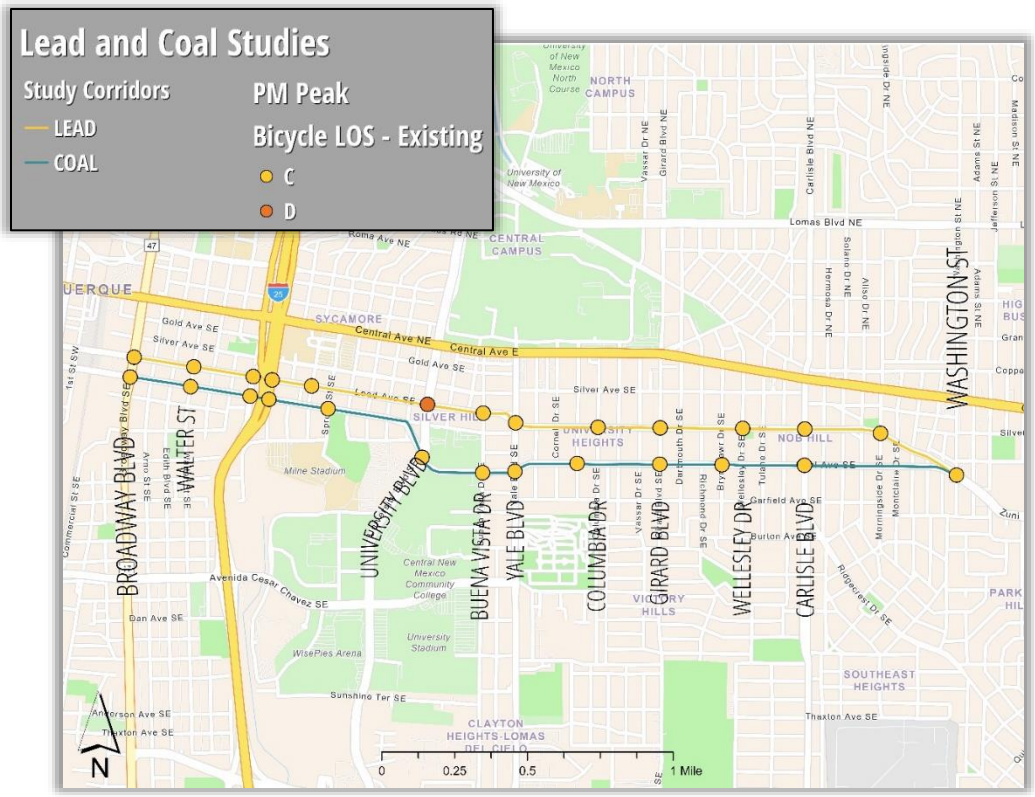

Figure 57: Bicycle LOS - Existing PM

BICYCLE LEVEL OF TRAFFIC STRESS (LTS)

Bicycle LTS is a qualitative tool that evaluates how comfortable and safe bicycle facilities may be for bicyclists based on stress-inducing factors. It assesses the facility based on traffic volume (AADT), traffic speed (85th percentile), facility type, road width, bicycle lane width, presence of parking, and the frequency of a blocked bicycle lane. BLTS uses a four-tiered system. The tiers are:

- LTS 1: Little to no stress. Comfortable for all bicyclists, including children
- LTS 2: Low Stress. Usable by most adult bicyclists but may be too stressful for children or inexperienced riders
- LTS 3: Moderate Stress. Comfortable only for experienced bicyclists
- LTS 4: High stress. Usable by confident or necessity-based riders

BLTS is used because it focuses on the bicyclist's perception of how safe a roadway feels, while Bicycle LOS evaluates efficiency and operational performance. Figure 58 shows the table for road segments with sidewalks and traffic volumes over 7,500 Average Annual Daily Traffic (AADT). The project team used an 85th percentile speed of 33 MPH for the 25 MPH alternative evaluation and 38 MPH for the others. These values are determined from the data collection efforts' worst-case scenario 85th percentile speeds. The green boxes indicate the portions of the tables used to evaluate the Lead and Coal corridors.

Table 2. Criteria for Bike Lanes Alongside a Parking Lane

	LTS ≥ 1	LTS ≥ 2	LTS ≥ 3	LTS ≥ 4
Street width (through lanes per direction)	1	(no effect)	2 or more	(no effect)
Sum of bike lane and parking lane width (includes marked buffer and paved gutter)	15 ft. or more	14 or 14.5 ft.[a]	13.5 ft. or less	(no effect)
Speed limit or prevailing speed	25 mph or less	30 mph	35 mph	40 mph or more
Bike lane blockage (typically applies in commercial areas)	rare	(no effect)	frequent	(no effect)

Note: (no effect) = factor does not trigger an increase to this level of traffic stress.

[a] *If speed limit < 25 mph or Class = residential, then any width is acceptable for LTS 2.*

Table 3. Criteria for Bike Lanes Not Alongside a Parking Lane

	LTS ≥ 1	LTS ≥ 2	LTS ≥ 3	LTS ≥ 4
Street width (through lanes per direction)	1	2, if directions are separated by a raised median	more than 2, or 2 without a separating median	(no effect)
Bike lane width (includes marked buffer and paved gutter)	6 ft. or more	5.5 ft. or less	(no effect)	(no effect)
Speed limit or prevailing speed	30 mph or less	(no effect)	35 mph	40 mph or more
Bike lane blockage (may apply in commercial areas)	rare	(no effect)	frequent	(no effect)

Note: (no effect) = factor does not trigger an increase to this level of traffic stress.

Figure 58: BLTS for Segments with and Without Adjacent Parking

Existing BLTS

The BLTS for the Existing conditions indicates that the entire corridor is a BLTS 3 despite the presence of bicycle lanes corridor-wide. Figure 59 shows the BLTS evaluation under Existing conditions.

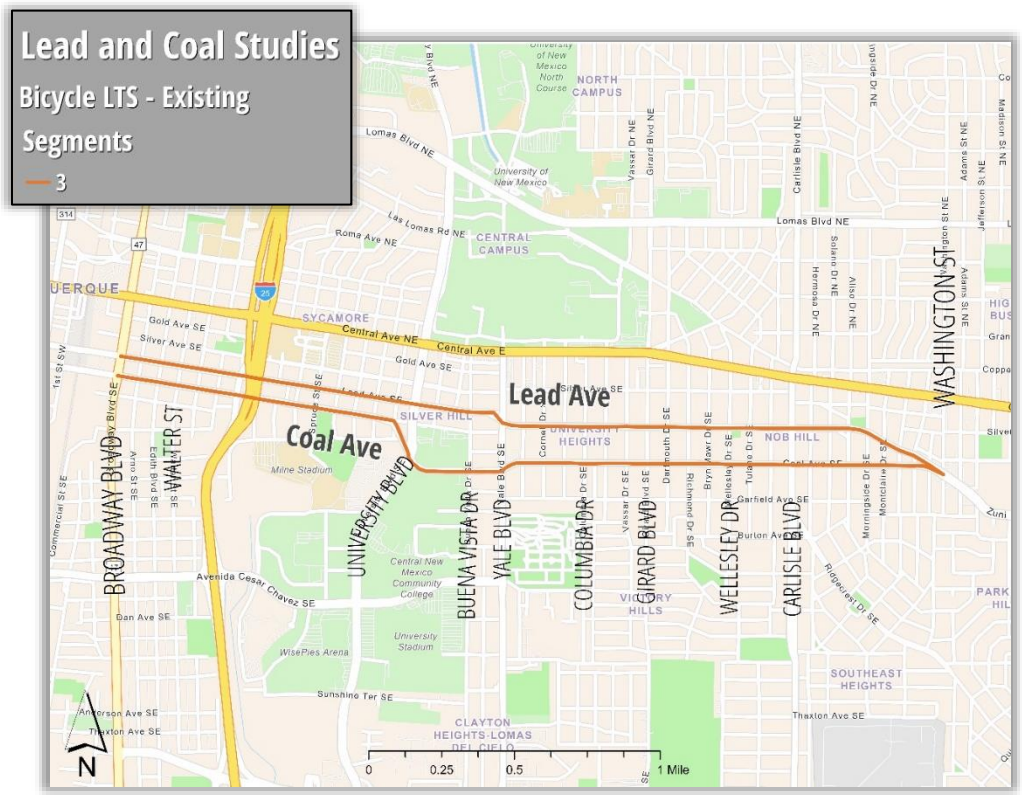

Figure 59: Bicycle LTS – Existing

Speed Reduction BLTS

The BLTS for the Speed Reduction conditions indicates that the entire corridor improves to a BLTS 2 due to a safer environment from lower speeds. As with the PLTS evaluation, this alternative hinges on speed limit compliance. Figure 60 shows the BLTS evaluation under the Speed Reduction alternative.

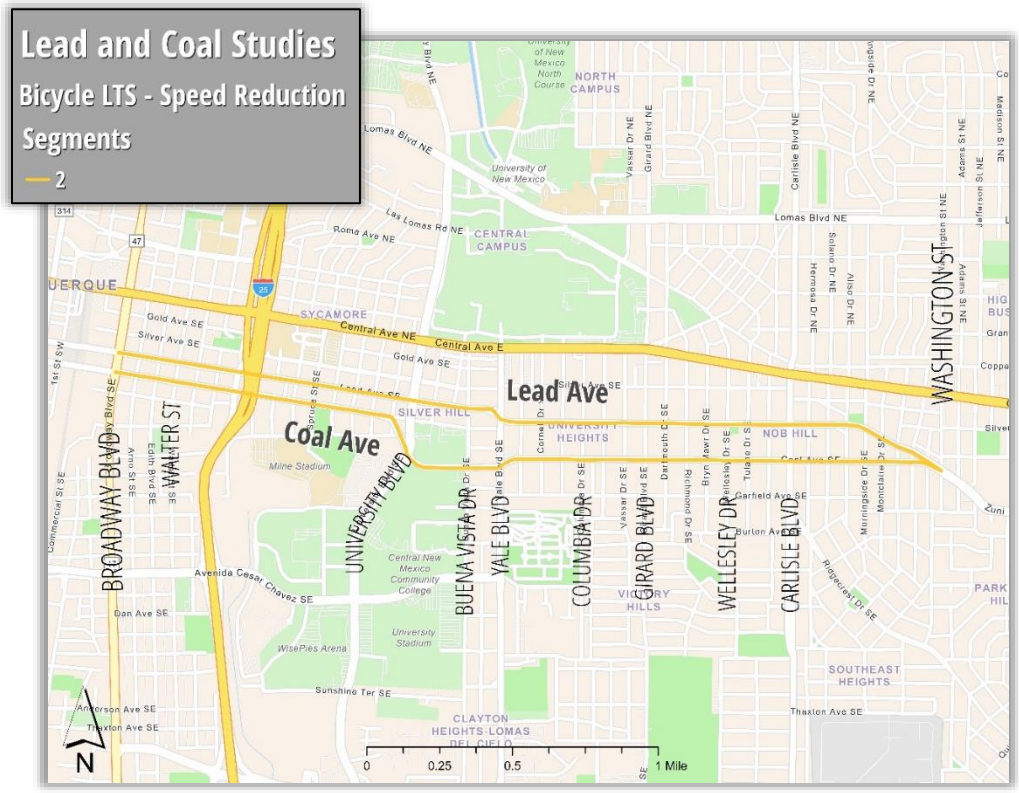

Figure 60: Bicycle LTS - Speed Reduction

Single-Lane BLTS

The BLTS for the Single-Lane alternative indicates that the entire corridor improves to a BLTS 1 due to a safer environment from greater space between motor vehicles and bicycles. However, this evaluation does not consider the safety hazard of motor vehicles using unused road space to erratically pass vehicles during congestion, which may become a safety challenge for bicyclists. Figure 61 shows the BLTS evaluation under the Single-Lane alternative.

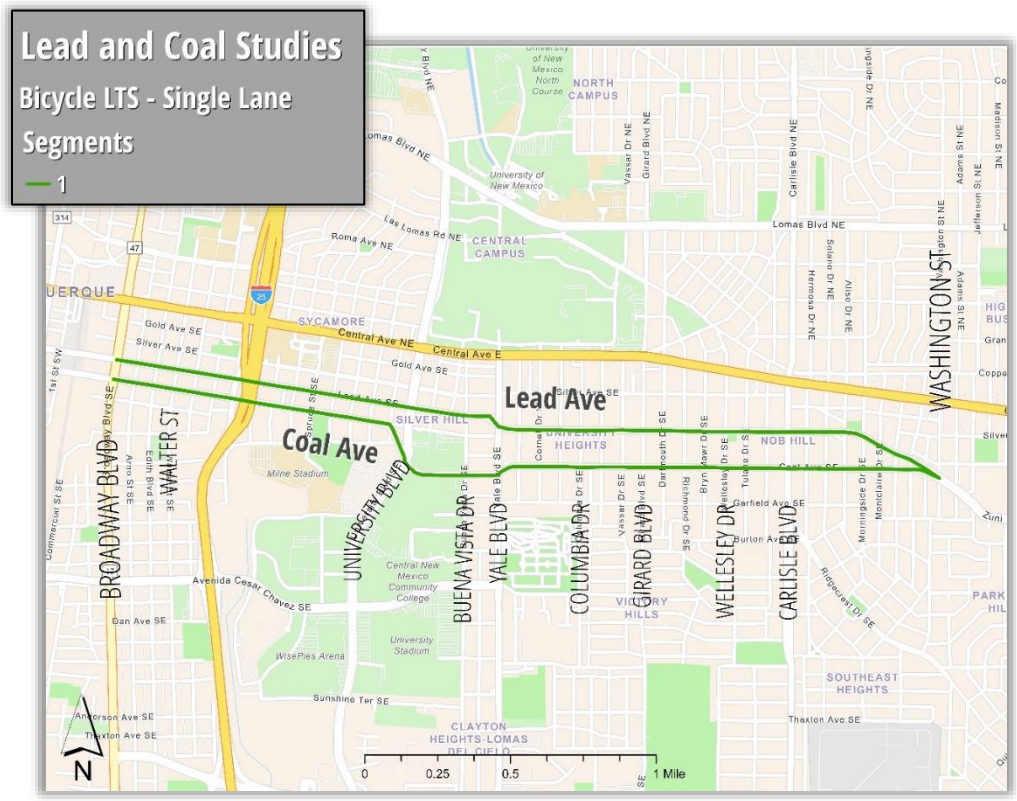

Figure 61: Bicycle LTS – Single-Lane

Two-Way BLTS

BLTS under Two-Way operations indicates that the corridor will be at BLTS 2. This is likely due to a negligible change to the bicycle facility and no increase in separation from motor vehicles. Figure 62 shows the BLTS evaluation under the Two-Way alternative.

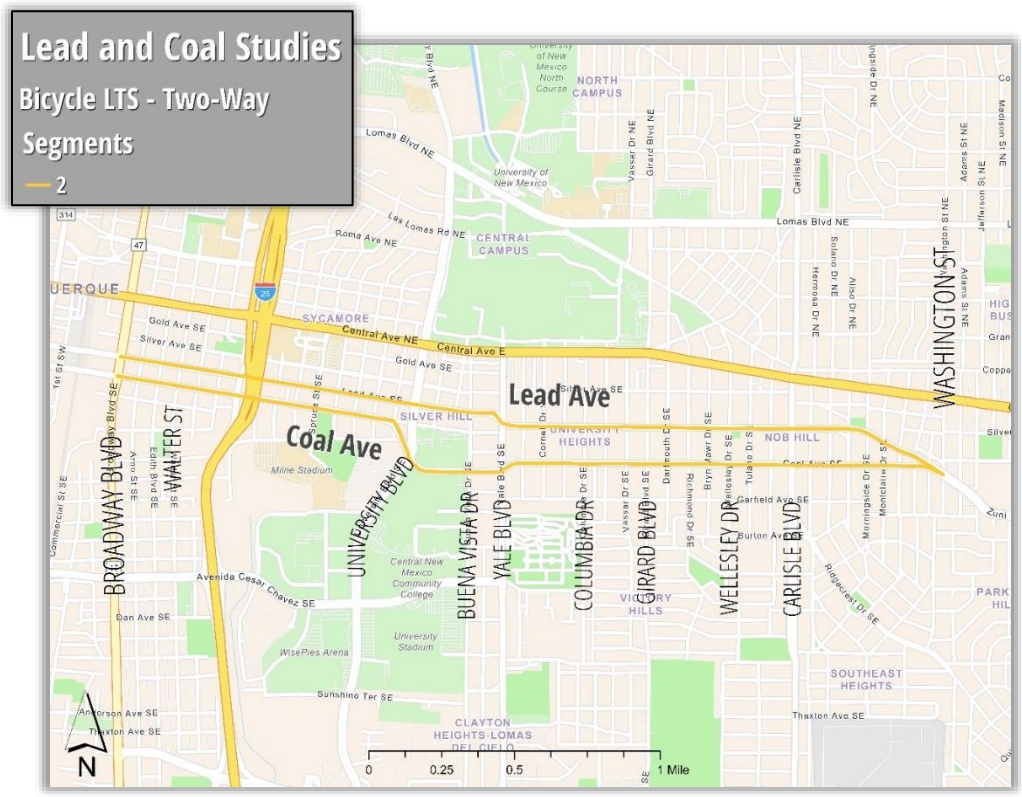

Figure 62: Bicycle LTS - Two-Way

ARTERIAL TRAVEL TIME

Arterial travel time is when it takes to travel a corridor from point A to point B. For Lead and Coal, arterial travel time is the time it takes a vehicle to travel from Broadway Boulevard to Washington Street and vice versa.

SEGMENT 1

Arterial travel times for the existing scenario were compared with the other scenarios. Table 19 summarizes the differences in travel times, starting with existing time and adding or subtracting time based on the scenario.

Table 19: Segment 1 Arterial Travel Times

Corridor	Scenario	Direction	AM Travel Time (mm: ss)	PM Travel Time (mm: ss)
Lead Ave	Existing	WB	1:25	1:35
	Speed Reduction	WB	+0:09	+0:05
	Single-Lane	WB	+0:35	+0:28
	Single-Lane - Yale to Washington	WB	-0:12	-0:02
	Two-Way	EB	-0:13	+0:27
		WB	+0:09	+0:08
Coal Ave	Existing	EB	1:53	2:05
	Speed Reduction	EB	+0:05	+0:08
	Single-Lane	EB	+0:57	+0:17
	Single-Lane - Yale to Washington	EB	-0:10	-0:14
	Two-Way	EB	-0:18	+0:19
		WB	+0:21	-0:16

Existing Arterial Characteristics

The AM and PM results indicate that the arterial characteristics are acceptable. Existing characteristics were also compared with other scenarios to determine how acceptable the delays and travel times would be.

Speed Reduction Arterial Characteristics

For Lead Avenue, there is a 10-second increase in the AM and an 18-second increase in the PM. For Coal Avenue, there is a 5-second increase in the AM and a 9-second increase in the PM.

Single Lane Operation Arterial Characteristics

For Lead Avenue, there is a 35-second increase in the AM and a 28-second increase in the PM. For Coal Avenue, there is a 57-second increase in the AM and a 17-second increase in the PM.

Single Lane Operation from Yale Boulevard to Washington Street

For Lead Avenue, there is a 12-second decrease in the AM and a 2-second decrease in the PM. For Coal Avenue, there is a 10-second decrease in the AM and a 14-second decrease in the PM.

Two-Way Operation Arterial Characteristics

For Lead Avenue in the eastbound direction, there is a 13-second decrease in the AM and a 27-second increase in the PM. For Lead Avenue in the westbound direction, there is a 9-second increase in the AM and an 8-second increase in the PM. For Coal Avenue in the eastbound direction, there is an 18-second decrease in the AM and a 19-second increase in the PM. For Coal Avenue in the westbound direction, there is a 21-second increase in the AM and a 16-second decrease in the PM.

SEGMENT 2

Arterial travel times for the existing scenario were compared with the other scenarios. Table 20 summarizes the differences in travel times, starting with existing time and adding or subtracting time, based on the scenario.

Table 20: Segment 2 Arterial Travel Times

Corridor	Scenario	Direction	AM Travel Time (mm: ss)	PM Travel Time (mm: ss)
Lead Ave	Existing	WB	2:34	2:39
	Speed Reduction	WB	+0:24	+0:20
	Single Lane	WB	+10:00	+5:00
	Single Lane – Add. Divers.	WB	+5:00	+3:00
	Single Lane - Yale to Washington	WB	+2:00	+1:00
	Two-Way	EB	-0:04	+0:51
		WB	+0:09	+0:23
Coal Ave	Existing	EB	2:48	4:12
	Speed Reduction	EB	+0:15	+1:00
	Single Lane	EB	+2:00	+4:00
	Single Lane – Add. Divers.	EB	+2:00	+3:00
	Single Lane - Yale to Washington	EB	-0:04	-0:17
	Two-Way	EB	-0:17	-1:00
		WB	+0:13	+1:00

Existing Arterial Characteristics

The AM and PM results indicate that the arterial characteristics are acceptable. Existing characteristics were also compared with other scenarios to determine how acceptable the delays and travel times would be.

Speed Reduction Arterial Characteristics

For Lead Avenue, there is a 26-second increase in the AM and a 29-second increase in the PM. For Coal Avenue, there is a 15-second increase in the AM and a 1-minute increase in the PM.

Single Lane Operation Arterial Characteristics

Initial Diversion

For Lead Avenue, there is a 10-minute increase in the morning and a 5-minute increase in the evening. For Coal Avenue, there is a 2-minute increase in the morning and a 4-minute increase in the evening.

Additional Diversion

For Lead Avenue, there is a 4-minute increase in the AM and a 3-minute increase in the PM. For Coal Avenue, there is a 2-minute increase in the AM and a 3-minute increase in the PM.

Single Lane Operation from Yale Boulevard to Washington Street

For Lead Avenue, there is a 2-minute increase in the AM and a 1-minute increase in the PM. For Coal Avenue, there is a 14-second decrease in the AM and a 17-second decrease in the PM.

Two-Way Operation Arterial Characteristics

For Lead Avenue in the eastbound direction, there is a 4-second decrease in the AM and a 51-second increase in the PM. For Lead Avenue in the westbound direction, there is a 9-second increase in the AM and a 23-second increase in the PM. For Coal Avenue in the eastbound direction, there is a 17-second decrease in the AM and a 1-minute decrease in the PM. For Coal Avenue in the westbound direction, there is a 13-second increase in the AM and a 1-second decrease in the PM.

SEGMENT 3

Arterial travel times for the existing scenario were compared with the other scenarios. Table 21 summarizes the differences in travel times, starting with existing time and adding or subtracting time, based on the scenario.

Table 21: Segment 3 Arterial Travel Times

Corridor	Scenario	Direction	AM Travel Time (mm: ss)	PM Travel Time (mm: ss)
Lead Ave	Existing	WB	3:38	4:08
	Speed Reduction	WB	+0:24	-0:22
	Single Lane	WB	+4:00	+0:54
	Single Lane – Add. Divers.	WB	+2:00	+0:65
	Single Lane - Yale to Washington	WB	+3:00	+1:00
	Two-Way	EB	-0:27	+0:38
		WB	-0:01	+2:00
Coal Ave	Existing	EB	+3:13	3:37
	Speed Reduction	EB	+0:00	+0:01
	Single Lane	EB	+0:05	+0:45
	Single Lane - Yale to Washington	EB	+0:11	+0:29
	Two-Way	EB	+0:15	+0:24
		WB	-0:05	+0:36

Existing Arterial Characteristics

The AM and PM results indicate that the arterial characteristics are acceptable. Existing characteristics were also compared with other scenarios to determine how acceptable the delays and travel times would be.

Speed Reduction Arterial Characteristics

For Lead Avenue, the AM is increased by 15 seconds, and the PM is decreased by 22 seconds. For Coal Avenue, the AM is increased by 20 seconds, and the PM is increased by 16 seconds.

Single Lane Operation Arterial Characteristics

Initial Diversion

For Lead Avenue, there is a 4-minute increase in the AM and a 54-second increase in the PM. For Coal Avenue, there is a 5-second increase in the AM and a 45-second increase in the PM.

Additional Diversion

In this segment, a diversion was only applied to Lead Avenue. For Lead Avenue, there is a 2-minute increase in the AM and a 1-minute increase in the PM. Though the secondary conversion provides less delay on the Lead and Coal corridors, it is essential to consider impacts on the surrounding roadways as traffic will likely divert to the closest corridors.

Single Lane Operation from Yale Boulevard to Washington Street

For Lead Avenue, there is a 3-minute increase in the AM and a 1-minute increase in the PM. For Coal Avenue, there is an 11-second increase in the AM and a 29-second increase in the PM.

Two-Way Operation Arterial Characteristics

For Lead Avenue in the eastbound direction, there is a 27-second decrease in the AM and a 38-second increase in the PM. For Lead Avenue in the westbound direction, there is a 1-second decrease in the AM and a 2-second increase in the PM. For Coal Avenue in the eastbound direction, there is a 15-second increase in the AM and a 24-second increase in the PM. For Coal Avenue in the westbound direction, there is a 5-second decrease in the AM and a 36-second increase in the PM.

NOISE ASSESSMENT

This noise assessment section is organized as follows. The first section discusses vehicle noise ordinances and other vehicle noise guidelines from Albuquerque and other jurisdictions to set a frame of reference for allowable vehicle noise levels. The data collection process discusses the findings in the following and third sections. The final section details different noise mitigation techniques and the pros and cons of each.

VEHICLE NOISE ORDINANCES AND GUIDANCE

First, Albuquerque's existing vehicle noise ordinance options are discussed. Then, examples of noise ordinances and vehicle noise guidance from other jurisdictions are discussed.

Vehicle Noise Ordinances for Albuquerque

Several ordinances are aimed at curtailing motor vehicle noise and apply to the City of Albuquerque. We first discuss those from the Albuquerque Code of Ordinances, including Albuquerque's Vehicle Nuisance Ordinance (Section 2.1.1.) and Albuquerque's Traffic Code (Section 2.1.2.). We then discuss the vehicle noise ordinance from the Bernalillo County Code (Section 2.1.3.). We finally discuss Albuquerque's general noise ordinance, which is likely inadequate for vehicle noise enforcement (Section 2.1.4.).

Albuquerque's Vehicle Nuisance Ordinance (Albuquerque Code of Ordinances; Chapter 7; Article 10)

The City of Albuquerque's Vehicle Nuisance Ordinance aims to improve the community's health and safety by prohibiting specific motor vehicle driving behaviors, including racing, drag racing, exhibition driving, road rage taunting, and other behaviors related to excessive roadway noise. The parts of the ordinance most applicable to road noise are provided below:

> § 7-10-2 FINDINGS AND INTENT.
>
> (B) The Council further finds that nuisance drivers' vehicles cause considerable property damage, bodily harm, and loss of life in the City of Albuquerque. The danger, noise, fear, and distraction produced and caused by nuisance drivers lead to immeasurable harm to the community. The noise and distraction generated by nuisance vehicles interfere with drivers' ability to detect and respond to dangerous or emergency driving conditions and circumstances, including but not limited to horn noise and the siren noise of official emergency vehicles. This Article aims to abate the nuisance caused by irresponsible drivers' use of cars by employing progressive sanctions, including temporary loss or permanent forfeiture of the vehicle.
>
> § 7-10-3 VEHICLE NUISANCE - SPECIFIC VIOLATIONS.
>
> (D) Excessively Loud Electronic Sound or Music. It shall be unlawful for any person or persons to play or produce excessively loud sound or music in any vehicle operated on any public street in the city limits. For purposes of this section, excessively loud electronic sound or music shall be, and the terms shall mean the use of any machine or device for reproducing sound, including any magnifying sound instrument used in the production or replication of music, spoken words, or other sounds and designed to enlarge the volume of any instrument, voice or other sounds including but not limited to radios, stereos or so-called "boom boxes." It shall be a violation of this section if any such sound is plainly audible twenty-five feet from the subject vehicle.

> (E) Modification of Exhaust Systems. It shall be a violation of this section for any person to operate any vehicle within city limits with a modified exhaust system. A modified exhaust system shall mean any change or alteration to the exhaust system found on the vehicle when it was originally manufactured, and such change results in noise that exceeds the noise the vehicle made when manufactured. Any violation of ROA 1994 § 8-6-13 shall also be a violation of this paragraph.

Mitigating excessive road noise from motor vehicles is a goal of the above ordinance. Based on results from the noise camera installation as part of this project and from other past noise camera monitoring around New Mexico, motor vehicle stereos rarely reach decibel levels that trigger the camera (approximately 80 dB(A) or greater), and almost all captures are a result of modified exhaust systems. Therefore, the city should likely focus on the exhaust system aspect of the Vehicle Nuisance Ordinance instead of the stereo aspect if they wish to maximize excessive motor vehicle noise enforcement. If the stereo aspect were enforced, what is "plainly audible" in decibels would likely need to be determined, as this is a subjective term. Furthermore, non-modified operating motor vehicles are plainly audible at twenty-five feet from the subject vehicle, primarily because of the contact between the vehicle's tires and the roadway; it may, therefore, be of interest to justify why a vehicle is allowed to be plainly audible at twenty-five feet, but the stereo is prohibited from being plainly audible at twenty-five feet.

The exhaust system portion of Albuquerque's Vehicle Nuisance Ordinance slightly differs from other vehicle noise ordinances that largely specify a maximum allowable decibel level. Instead, Albuquerque's ordinance specifies that vehicle exhaust systems are prohibited from making more noise than when they were originally manufactured. Enforcement of this ordinance should be possible if stock noise levels can be obtained from vehicle manufacturers. However, with a wide range of options available for motor vehicles, it may be challenging to identify the noise level of a vehicle's exhaust system when it was originally manufactured. For this reason, vehicle ordinances that specify maximum allowable decibel levels (such as Bernalillo County's Vehicle Noise Ordinance detailed in Section 2.1.3.) may be more appropriate.

Albuquerque's Traffic Code (Albuquerque Code of Ordinances; Chapter 8; Article 6)

The City of Albuquerque's Traffic Code has a section specifically requiring motor vehicles operated within city limits to have a muffler in good working order:

> § 8-6-13 MUFFLERS REQUIRED.
>
> (A) *Operating Muffler.* It shall be unlawful for any person to operate a motor vehicle if it is not equipped with a properly attached operating muffler in good working order of construction sufficient to prevent excessive or unusual noise of the motor or to muffle or deaden the sound from the motor.
>
> (B) *Muffler Changes or Modification.* No person shall modify or change the exhaust muffler, intake muffler, or any other noise abatement device of a motor vehicle such that the noise emitted by the motor vehicle is increased above that emitted by the motor vehicle as originally manufactured. Such prohibited changes or modifications shall include but are not limited to cut-outs, by-passes, illegal mufflers defined in division (C) below, or other similar devices.
>
> (C) *Dealers and the like.* No person shall sell, offer for sale, install, or offer to install any illegal muffler, exhaust cut-out, by-pass, or other device that increases or tends to increase the

> exhaust noise of a motor vehicle. For this section, an illegal muffler is defined as any straight-through muffler that does not contain baffles, including but not limited to glass packs, steel packs, and straight pipes.

Albuquerque's Traffic Code is similar to its Vehicle Nuisance Ordinance, focusing on muffler and exhaust systems. However, there is one key benefit to the Traffic Code's approach in that it is not required to prove that a modification has occurred. Whereas enforcement of the Vehicle Nuisance Ordinance would require proving that the vehicle's exhaust system had been modified, the Traffic Code states: "It shall be unlawful for any person to operate a motor vehicle if such vehicle is not equipped with a properly attached, operating muffler in good working order of construction sufficient to prevent excessive or unusual noise of the motor or to muffle or deaden the sound from the motor." In this way, enforcement should be possible without the additional burden of proving that an exhaust system has been modified from some previous state. However, the terms "excessive or unusual noise" are still subjective, and it would be ideal to have a specific decibel level associated with the criteria. Furthermore, it may need to be proven that the observed noise is generated explicitly because of a lack of a muffler.

Bernalillo County's Vehicle Noise Ordinance (Bernalillo County Code of Ordinances; Chapter 30; Article IV)

Bernalillo County has a vehicle noise ordinance that could be used by the City of Albuquerque and that avoids many of the issues detailed above:

> Sec. 30-123. - Vehicles.
>
> (b) Motor-driven vehicles. Motor-driven vehicle restrictions are as follows:
>
> (1) It shall be unlawful for any person to operate any motor-driven vehicle within the county in such a manner that a person residing in the area is caused discomfort or annoyance.
>
> (4) No person shall operate within the speed limits specified in this section either a motor vehicle or combination of vehicles of a type subject to registration at any time or under any condition of grade, load, acceleration, or deceleration in such manner as to exceed the following noise limits for the category of motor vehicles, based on a distance of not less than 50 feet from the centerline of travel under test procedures established by subsection (b)(10) of this section:

	Type of Vehicle	Noise Limit in Relation to Posted Speed Limit (dB(A))	
		35 mph or less	Over 35 mph
a.	Any motor vehicle with a manufacturer's GVW rating of 8,000 pounds or more and any combination of vehicles towed by such motor vehicle		
	Before January 1, 1973	88	90
	After January 1, 1973	86	90
b.	Any motorcycle other than a motor-driven cycle		
	Before January 1, 1978	82	86
	After January 1, 1978	78	82
c.	Any other motor vehicle and any combination of motor vehicles towed by such motor vehicle		
	After January 1, 1970	76	82

After January 1, 1978	70	79	

This section applies to the total noise from a vehicle or combination of vehicles and shall not be construed as limiting or precluding the enforcement of any other provisions of this Code relating to motor vehicle mufflers for noise control.

(10) Test procedures to determine whether maximum noise emitted by motor vehicles in use meet the noise limits stated in subsection (b)(4) of this section shall be in substantial conformity with standards and recommended practice established by the Society of Automotive Engineers, Inc., including SAE Standard J986; SAE Standard J331; Recommended Practice J366; Recommended Practice J184; and such other and further standards as may be propounded by the county department of environmental health.

Bernalillo County's Vehicle Noise Ordinance avoids many of the abovementioned issues with Albuquerque's ordinances. For instance, while both Albuquerque ordinances detailed above require the excessive noise to be coming from a muffler or exhaust system, Bernalillo County's noise ordinance states that: "No person shall operate…a motor vehicle… under any condition of grade, load, acceleration or deceleration in such manner as to exceed the following noise limits..." In this way, enforcement is possible as long as it can be proven that the noise is coming from the operating motor vehicle without requiring identification of the exact source (i.e., exhaust system, stereo, etc.).

The issue of defining the subjective terms "nuisance," "excessive," and "unusual" is also avoided by providing specific decibel ranges that can be measured objectively. Specific testing criteria are also provided to avoid ambiguity further.

Albuquerque's General Noise Ordinance (Albuquerque Code of Ordinances; Chapter 9; Article 9)

Although it is likely not ideal for enforcement of motor vehicle noise, we provide Albuquerque's General Noise Ordinance below:

§ 9-9-4 GENERAL NOISE.

(A) Except as otherwise provided in this article, no person shall make or continue, cause to be made or continued, or allow to be made or continued, any sound that persistently or continuously results in an exceedance of the following sound level limits using an approved sound-level meter measuring decibels on the A-Weighted scale.

	Receptor Premises					
Numbers indicate decibel (dB) levels	*Residential*		*Commercial and Downtown Arts and Entertainment Focus Area*		*Industrial/ Manufacturing and Public Premises*	
Source Premises	*Daytime*	*Nightti me*	*Daytime*	*Nighttime*	*Daytime*	*Nighttime*
Residential	55	50	65	60	75	70
Commercial and Downtown Arts and Entertainment Focus Area	55 (indoor) 60 (outdoor)	50 (indoor) 55 (outdoor)	65	60	75	70
Industrial/Manufacturing and Public Premises	55 (indoor) 60 (outdoor)	50 (indoor) 55 (outdoor)	65	60	75	70

A key issue with the general noise ordinance is that the sound must "persistently or continuously" meet the specified decibel levels. An operating motor vehicle may only meet those decibel levels briefly at any monitoring location before driving off. Furthermore, the decibel levels are low enough for most unmodified standard passenger vehicles to surpass them. Therefore, General noise ordinances are not tailored for enforcing excessive motor vehicle noise.

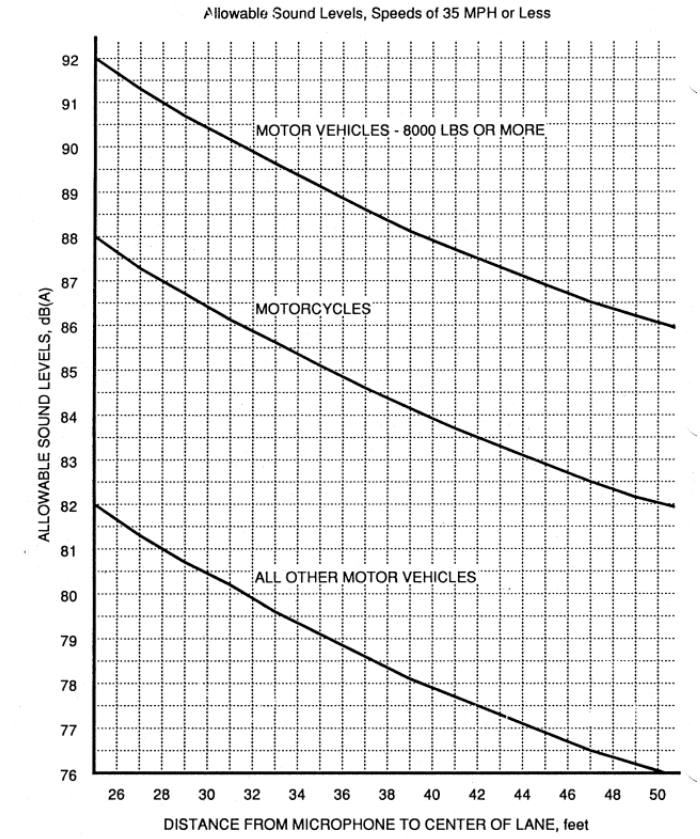
Other Vehicle Noise Ordinances and Guidance

Other jurisdictions with ordinances specific to vehicle noise are detailed below to provide context. This is not an exhaustive list.

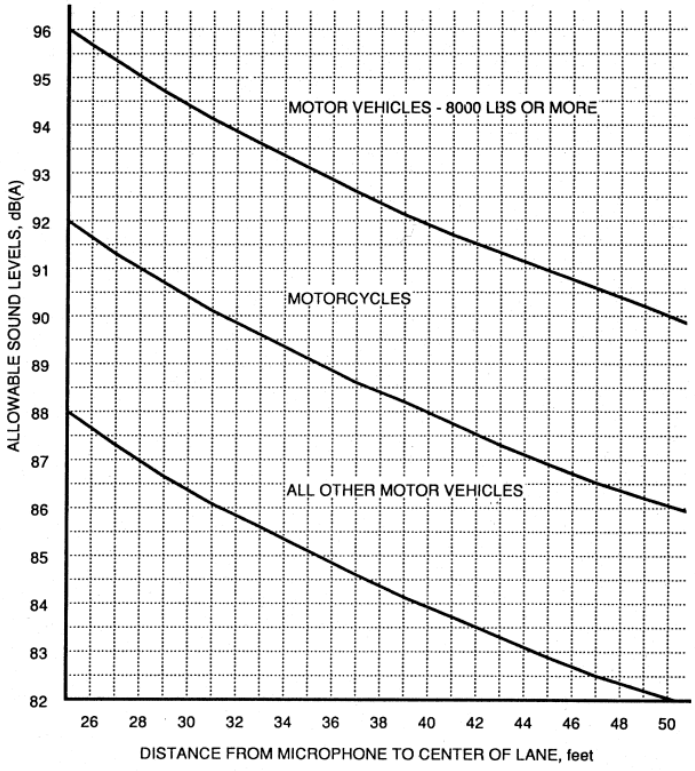
New York City Vehicle Noise Ordinance (The Rules of the City of New York; Title 15; Chapter 6)

The vehicle noise ordinance for New York City is detailed below to illustrate an alternative approach to one of the shortcomings of the Bernalillo County vehicle noise ordinance. Namely, the Bernalillo County vehicle noise ordinance specifies that sound level measurements must be "…based on a distance of not less than 50 feet from the centerline of travel…". This specification of not less than 50 feet from the centerline of travel might place the measurement device outside the right-of-way on many roadways. New York City provides tables of allowable decibel levels from a range of different measurement distances from 25 feet up to 50 feet, which is likely more practical for measurements on the side of a roadway. Note that the decibel thresholds at 50 feet specified by New York City are similar to those specified by Bernalillo County.

> Chapter 6: Interpolation of Allowable Sound Levels For Motor Vehicles
>
> Figure 1 and Figure 2 set forth below relate to allowable sound levels for motor vehicles as specified in § 24-232(a) of the Administrative Code (Noise Control Code). These figures shall be used for the interpolation between Column I and Column II of Table I of said section to determine the allowable sound levels for motor vehicles operated at speeds of 35 miles per hour or less and speeds of more than 35 miles per hour, respectively, at distances between twenty-five and fifty feet from the center of the lane of the public highway in which the motor vehicle is idling or is traveling.



SECTION 603 FIGURE 2:
Allowable Sound Levels, Speeds of More than 35 MPH



FHWA Traffic Noise Guidance

The guidance below is taken from the Federal Highway Administration's (FHWA) *Highway Traffic Noise: Analysis and Abatement Guidance*. Permissible noise emission levels per the Environmental Protection Agency (EPA) for individual vehicles (specifically trucks with gross vehicle weight ratings (GVRW) over 10,000 pounds) are first discussed. Then, general roadway noise levels representing Noise Abatement Criteria (NAC) from 23 CFR Part 772 are detailed.

The FHWA vehicle noise guidance that most closely relates to the local ordinances detailed above are the EPA regulations for trucks with GVRW over 10,000 pounds. No maximum noise levels for individual passenger vehicles or motorcycles are detailed in FHWA's *Highway Traffic Noise: Analysis and Abatement Guidance*. While Table 22 specifies maximum noise levels for newly manufactured trucks, Table 23 is likely more applicable to the local ordinances discussed above regarding "in-use" trucks. While a 50-foot measurement distance is again utilized, the EPA maximum noise levels appear more restrictive than the local ordinances detailed above. For instance, on roadways over 35 mph, Bernalillo County's ordinance allows vehicles with a GVRW of 8,000 pounds or more to emit a maximum of 90 dB(A). In contrast, the EPA allows vehicles with a GVRW of 10,000 pounds or more to emit a maximum of 87 dB(A).

*Table 22: Maximum Noise Emission Levels as Required by EPA for Newly Manufactured Trucks with GVWR Over 10,000 Pounds (Source: FHWA's Highway Traffic Noise: Analysis and Abatement Guidance) (*Using the Society of Automotive Engineers, Inc. (SAE) test procedure for acceleration under 35 mph))*

Effective Date	Maximum Noise Level 50 Feet from Centerline of Travel*
January 1, 1988	80 dB(A)

Table 23: Maximum Noise Emission Levels as Required by EPA for In Use Medium and Heavy Trucks with GVWR Over 10,000 Pounds Engaged in Interstate Commerce (Source: FHWA's Highway Traffic Noise: Analysis and Abatement Guidance)

Effective Date	Speed	Maximum Noise Level 50 Feet from the Centerline of Travel
January 8, 1986	<35 mph	83 dB(A)
	>35 mph	87 dB(A)
	Stationary	85 dB(A)

If a highway project is predicted to approach, meet, or exceed the NACs detailed in Table 24, FHWA recommends that noise abatement be considered and implemented if feasible and reasonable. The NACs are measured in Leq over an hour, which can be considered the average noise level over an hour. The Lead/Coal corridors likely fall under activity category B[3] with an exterior NAC of 67 dB(A).

Table 24: Noise Abatement Criteria from 23 CFR Part 772 in Hourly dB(A) Sound Levels (Source: FHWA's Highway Traffic Noise: Analysis and Abatement Guidance)

Activity Category	Activity Criteria		Evaluation Location	Activity Description
	Leq(h)	L10(h)		
A	57	60	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B[3]	67	70	Exterior	Residential

C[3]	67	70	Exterior	Active sports areas, amphitheaters, auditoriums, campgrounds, cemeteries, daycare centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52	55	Interior	Auditoriums, daycare centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E[3]	72	75	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties, or activities not included in A-D or F.
F	--	--	--	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.
G	--	--	--	Undeveloped lands that are not permitted.

Noise Data Collection

We first detail the collection of decibel levels using sound level meters. We then detail the identification of vehicle types with a noise camera.

Decibel Level Data Collection with Sound Level Meters

Sound level meters were used to collect sound level measurements in A-weighted decibels (dB(A)) at eight locations along the Lead/Coal corridor: Lead & Solano (location #1 in Figure 63), Lead & Tulane (#2), Lead & Cornell (#3), Lead & Buena Vista (#4), Lead & Mulberry (#5), Lead & Edith (#6), Coal & Cornell (#7), and Coal & Amherst (#8). The sound level meters were installed approximately 15 feet above ground level on utility poles located as closely as possible to the locations noted in Figure 63. Collections were taken for about 53 hours between approximately 8:00 AM on Tuesday, September 24, 2024, and 1:00 PM on Thursday, September 26, 2024.

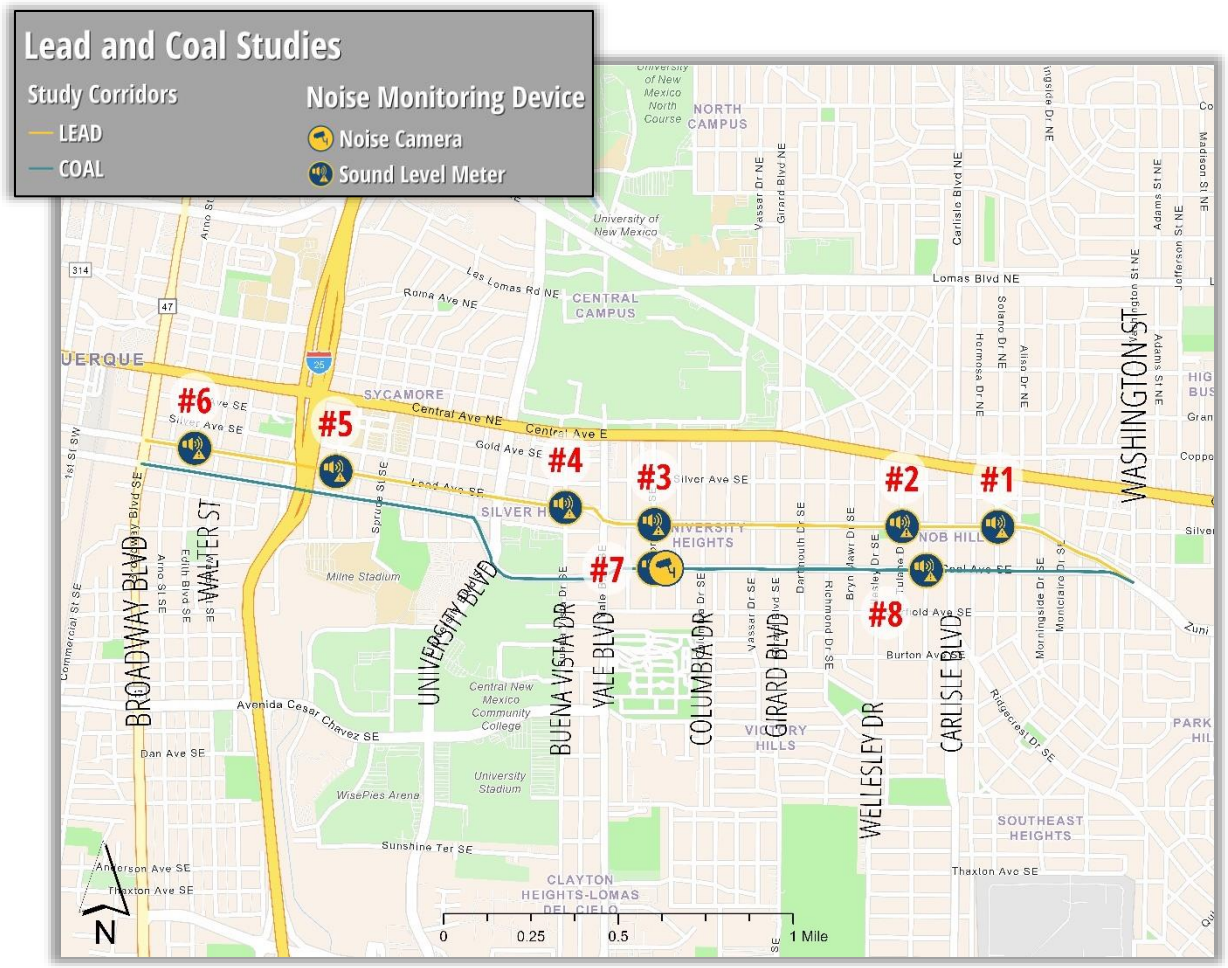


Figure 63: Lead/Coal Avenue Sound Level Monitoring Locations

REED R8070SD Data Logging Sound Level Meters were utilized for noise monitoring. These meters are certified to Type 2 standards (± 1.0 dB) according to IEC 61672-1-2013. The sound level meters were calibrated immediately before deployment in the field and were confirmed to still be within ±0.1 dB(A) when uninstalled. Each sound level meter recorded one dB(A) reading every second throughout the study period.

The data was then processed to identify the number of high-noise events (e.g., noise events above 80 dB(A) and noise events above 90 dB(A)) at each monitoring location, as well as the average decibel levels throughout the study period. Distinct noise events were differentiated using a four-second gap. In other words, take as a hypothetical situation that a single loud vehicle driven by a sound level meter produced decibel readings above 80 dB(A) for six seconds, which would result in six readings above 80 dB(A). Instead of counting this as six high-noise events, we counted all immediately subsequent ≥80dB(A) readings as a single event until there was a gap of at least four seconds between ≥80dB(A) readings.

It should be noted that while sound level meters can record decibel levels, they cannot identify the noise source. In other words, while the sound level meters identified high-noise events along the study roadways, and one could reasonably assume that those high-noise events may be primarily caused by

operating motor vehicles, it is possible that some of the high-noise events recorded by the sound level meters were caused by other noise sources (e.g., gunshots, leaf blowers, etc.). Because of the inability of sound level meters to identify noise sources, a noise camera was also installed in the corridor.

Vehicle Type Identification with Noise Camera

A noise camera was also installed during the monitoring period between approximately 11:00 AM on Tuesday, September 24, 2024, and 1:30 PM on Thursday, September 26, 2024. The noise camera was installed on Coal Avenue between Cornell Drive SE and Stanford Drive SE, approximately 24 feet from the centerline of the traveled way and within 300 feet of monitoring location #7 from Figure 63.

The noise camera consisted of a camera that was triggered whenever an 80 dB(A) threshold was surpassed. The camera's video capture and noise source localization allowed for identifying the noise source for each high-noise event during the study period. If the noise source was a motor vehicle, the vehicle type (e.g., heavy vehicles, pickup trucks, motorcycles, sports cars, etc.) of the noise source could be identified in the video capture. The license plate camera was not enabled during this study to avoid privacy issues. Identifying the vehicle type will inform whether further enforcement of truck restrictions may help improve noise pollution along the corridors.

Findings

We first discuss findings from the sound level meters, namely the average decibel levels and the number of high-noise events. We then discuss the identification of the noise sources using the noise cameras.

Sound Level Meter – Decibel Level Results

Average Traffic Noise Levels

While noise levels averaged across all times of day did not exceed or approach FHWA's noise abatement criteria of 67 dB(A) for residential areas (Table 24), the noise abatement criteria were exceeded or approached (i.e., within 1.0 dB(A)) during the loudest hour of the day at four of the eight study locations (Table 25). The westernmost parts of the study corridor, such as Lead & Mulberry and Lead & Edith, had the highest average noise levels.

Table 25: Average Noise Levels in dB(A)
(values approaching or exceeding FHWA's noise abatement criteria in bold)

Location	Total	Day 07:00-19:00	Night 19:00-07:00	Loudest Hour	
				dB(A)	Start Time
Lead & Solano	57.1	61.6	51.7	65.1	8:23:07 AM
Lead & Tulane	57.8	62.6	52.0	65.9	7:22:49 AM
Lead & Cornell	59.4	63.6	54.2	**67.3**	7:16:07 AM
Lead & Buena Vista	57.2	61.2	53.0	64.3	7:30:49 AM
Lead & Mulberry	61.9	64.9	58.2	**68.1**	7:09:35 AM
Lead & Edith	59.8	64.0	54.9	**68.7**	7:35:42 AM
Coal & Cornell	58.7	63.4	53.0	**66.1**	7:32:16 AM
Coal & Amherst	56.5	59.8	51.5	62.5	7:34:11 AM

High-Noise Events

The number of observed high-noise events along the study corridor is detailed in Table 26**.** Findings are presented as the rate of minutes per event for ≥80 dB(A) noise events and the rate of hours per event for ≥90 dB(A) noise events. For example, the results can be interpreted as one ≥80 dB(A) noise event

observed every 4.0 minutes during the day at the Lead & Solano monitoring location. The 80 dB(A) threshold is roughly equivalent to the legal limit for motor vehicles with a gross vehicle weight (GVW) rating of less than 8,000 pounds (excluding motorcycles, which have a higher noise limit) in Bernalillo County. It is important to note that while many high-noise events are likely a result of motor vehicles, the noise source cannot be substantiated by sound level meter readings alone.

Table 26: High-Noise Event Rates

Location	≥80 dB(A) rate of *minutes/event*			≥90 dB(A) rate of *hours/event*		
	Total	**Day 07:00-19:00**	**Night 19:00-07:00**	**Total**	**Day 07:00-19:00**	**Night 19:00-07:00**
Lead & Solano	6.2	4.0	18.7	2.1	1.3	8.0
Lead & Tulane	19.6	12.6	60.0	7.6	4.8	24.0
Lead & Cornell	13.5	8.9	36.0	7.6	5.8	12.0
Lead & Buena Vista	29.6	20.4	57.6	4.2	3.2	6.0
Lead & Mulberry	9.9	6.9	20.3	2.5	2.2	3.0
Lead & Edith	11.3	7.8	24.0	2.2	1.5	4.8
Coal & Cornell	16.0	10.6	42.4	4.1	2.7	12.0
Coal & Amherst	14.2	9.8	45.8	3.3	2.0	na

As with the average noise levels detailed above, the western end of the study corridor experienced some of the worst rates of high-noise events (Table 26). For example, Lead & Mulberry and Lead & Edith experienced an ≥80 dB(A) noise event every 6.9-7.8 minutes throughout the day. However, the worst section was Lead & Solano, which experienced an ≥80 dB(A) noise event every 4.0 minutes throughout the day. High-noise events were less frequent at night, although the worst sections of the corridor still experienced an ≥80 dB(A) noise event every 18.7-24.0 minutes throughout the night.

The worst parts of the corridor for ≥90 dB(A) noise events experienced one such event every 1.3-2.2 hours throughout the day (Table 26). Four monitoring locations experienced a ≥90 dB(A) noise event every 8.0 hours or less at night, meaning at least one such event every night.

Noise Camera – Vehicle Identification Results

Of the 171 total triggers of ≥80 dB(A) over the approximately 50.5 hours that the noise camera was installed, 157 (91.8%) triggers were caused by a motor vehicle in the study corridor (Figure 64). The 14 (8.2%) other triggers were either caused by a motor vehicle on another road (7 or 4.1%) or an unknown source (7 or 4.1%).

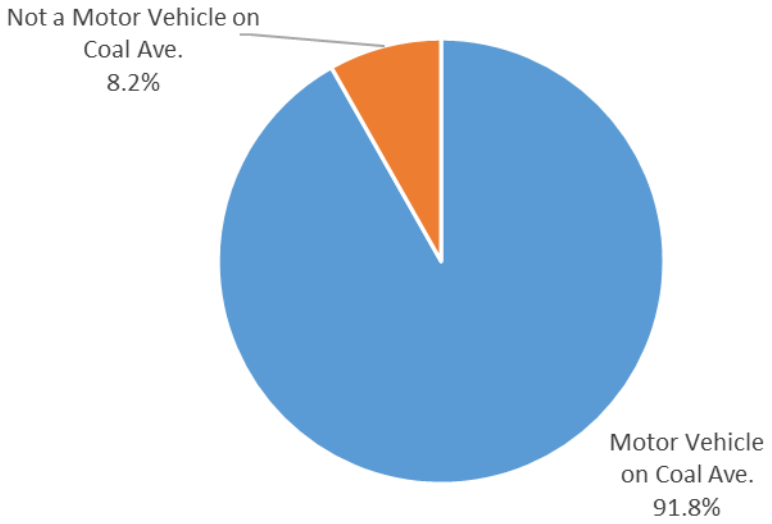

Figure 64: Noise Sources for Noise Camera Triggers of ≥80 dB(A) on Coal Avenue

Of the 157 triggers caused by motor vehicles, the most frequent vehicle type was pickup truck with 51 cases (32.5%), followed by motorcycle (36 cases or 22.9%), passenger car (19 cases or 12.1%), and SUV (17 cases or 10.8%) (Figure 65). It is important to note that Bernalillo County's vehicle noise ordinance specifies that on roads with speed limits of 35 mph or less (which includes the study location on Coal Avenue), any motor vehicle with a manufacturer's GVW rating of 8,000 pounds or more is allowed to generate up to 86 dB(A), motorcycles are allowed to generate up to 78 dB(A), and all other motor vehicles are allowed to generate up to 70 dB(A) at fifty feet. Therefore, some of the captured pickup trucks and motorcycles may be within their legal noise limits; further identification of individual vehicle weight characteristics would be required to determine the legal status of any individual vehicle.

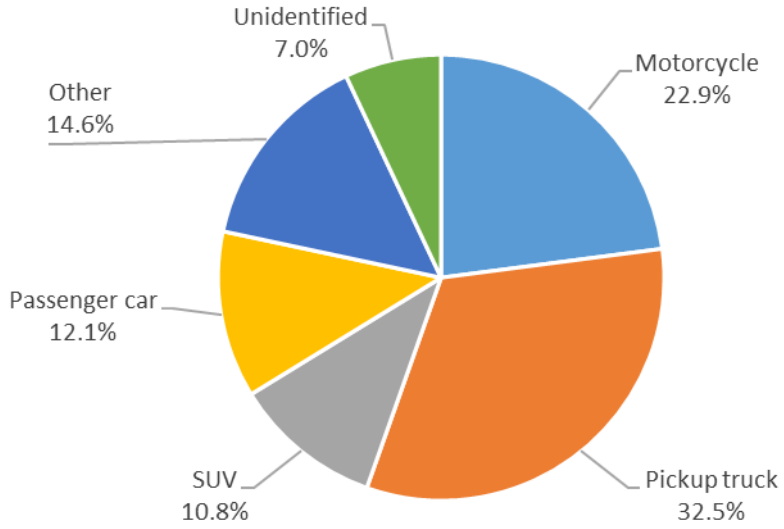

Figure 65: Vehicle Type for Motor Vehicles Triggering the Noise Camera at ≥80 dB(A) on Coal Avenue

The "Unidentified" category in Figure 65 included 11 (7.0%) unidentified captures, consisting of motor vehicles that were too tightly platooned to identify which vehicle was generating the high-noise event. The "Other" captures in Figure 65 included box trucks (a count of 4 or 2.5% of the total motor vehicles captured; box trucks consisted of rentals such as U-Haul and Penske), city buses (2 or 1.3%), fire trucks (2 or 1.3%), food truck (1 or 0.6%), front loader (1 or 0.6%), police cars (4 or 2.5%), school buses (4 or 2.5%), tow trucks (2 or 1.3%), and trash trucks (3 or 1.9%).

The private vehicles likely violating the 5-ton truck restriction at the study location were the four box trucks, one food truck, and two tow trucks for seven private vehicles or 4.5% of the total motor vehicles captured. The non-emergency municipal vehicles that likely weighed more than five tons were the two city buses, four school buses, and three trash trucks, for nine non-emergency municipal vehicles, or 5.7% of the total motor vehicles captured.

Motorcycles were disproportionately loud in the captured sample. Of the 16 motor vehicles that were captured at ≥90 dB(A), ten (62.5%) were motorcycles. There were also two pickup trucks (12.5%), two passenger cars (12.5%), and four police cars (25.0%) captured at ≥90 dB(A). All motorcycles that were captured had an average of 85.3 dB(A) versus an average of 82.9 dB(A) for passenger cars, 82.2 dB(A) for pickup trucks, and 81.2 dB(A) for SUVs.

Noise Mitigation Techniques

The guidance below regarding noise mitigation techniques was largely based on FHWA's *Highway Traffic Noise: Analysis and Abatement Guidance*. Traffic noise abatement techniques approved by FHWA include noise barriers, managing traffic (including truck restrictions), vegetation, and installing noise insulation in buildings. Note that while the guidance is for highways, applying techniques to urban areas is discussed and, therefore, may apply to the study.

Noise Barriers

Noise barriers are the most prevalent form of noise abatement. Noise barriers are solid obstructions built between the roadway and the noise receivers. Effective noise barriers can reduce noise levels by 10 decibels. While noise barriers may effectively mitigate noise, they are inappropriate in all contexts. FHWA details context considerations that are likely applicable to the Lead/Coal corridor:

> "A major consideration in the design of a noise barrier is the visual impact on the adjoining land use. An important concern is the scale relationship between the barrier and activities along the roadway right-of-way. A tall barrier near a low-scale single-family detached residential area could have a severe adverse visual effect. In addition, a tall barrier placed close to residences could create detrimental shadows. One solution to the potential problem of scale relationship is to provide staggered horizontal elements to a noise barrier to reduce the visual impact through the introduction of landscaping in the foreground. This can also allow for additional sunlight and air movement in the residential area. In general, it is desirable to locate a noise barrier approximately four times its height from residences and to provide landscaping near the barrier to avoid visual dominance."

Given the limited right-of-way along the Lead/Coal corridor and the residential context, noise barriers are likely not a realistic solution for noise abatement.

Traffic Control (Including Truck Restrictions)

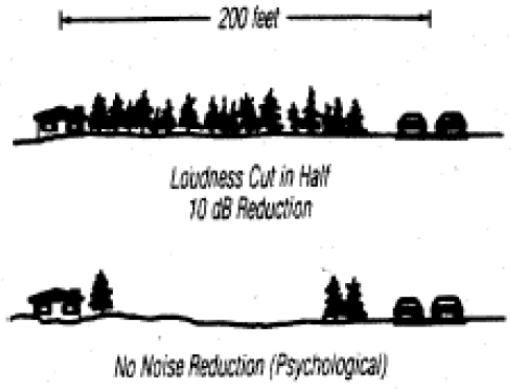
FHWA also recommends traffic control methods for noise mitigation, including:

1. Prohibiting trucks from certain streets and roads,
2. Permitting trucks to use certain streets and roads only during daylight hours,
3. Timing traffic lights to achieve smooth traffic flow and eliminate the need for frequent acceleration and deceleration,
4. Reducing speed limits reduces traffic noise levels; however, an approximate reduction of 20 mph is necessary for a readily perceptible decrease in noise levels.

Given the findings above from the noise cameras regarding the relatively few motor vehicles violating the existing truck restrictions, further truck restrictions or further enforcement of existing truck restrictions will likely not significantly ameliorate the noise issues observed on the Lead/Coal corridor. The noise issues observed at the study site were not related to signal timing, and further reducing the speed limit by the recommended 20 MPH was not feasible in the study corridor. Therefore, the traffic control noise mitigation techniques suggested by FHWA are likely not applicable solutions for the observed Lead/Coal noise issues.

Vegetation

FHWA suggests vegetation as a possible noise mitigation technique, although they note that vegetation is infrequently feasible given the width and density of vegetation required to dampen noise. For instance, FHWA estimates that a 200-foot width of dense vegetation would be required to reduce noise by 10 decibels (Figure 66). Planting trees and shrubs may provide psychological benefits by providing visual screening, but it typically does not function as noise abatement. Vegetation is, therefore, not a feasible noise mitigation technique for the Lead/Coal corridor.



Source: FHWA Highway Traffic Noise: Analysis and Abatement Guidance

Figure 66: Vegetation as Noise Mitigation Technique

Noise Insulation

The final noise mitigation technique suggested by FHWA is noise insulation installed directly on or in affected buildings. However, FHWA notes that highway agencies typically only consider noise insulation for public use or nonprofit institutional structures (e.g., places of worship, schools, hospitals, libraries,

etc.). Directly modifying private residences is not a standard procedure and is likely not a noise mitigation approach that is pertinent for a city. Therefore, it is likely that none of the above standard noise mitigation techniques detailed by FHWA are appropriate to the Lead/Coal corridor.

Automated Noise Enforcement

Although not mentioned by the FHWA, automated noise enforcement via noise cameras may be an effective approach for the Lead/Coal corridor. Noise cameras, such as the unit used for vehicle type identification in this study, constantly measure decibel levels along a roadway and are triggered when a set decibel threshold is surpassed. The noise camera can localize the noise source to confirm which motor vehicle is generating the offending noise and identify the individual vehicle via a license plate camera. In addition, decibel levels and audio are recorded throughout each capture to provide additional evidence.

Noise cameras are a relatively new technology and are not yet widely used in the United States. New York City is the only known municipality issuing citations based on noise camera data, although several other cities have completed noise camera pilot programs. To successfully mitigate vehicle noise along the Lead/Coal corridor with noise cameras, the city would need to issue warnings or citations to vehicle owners violating any of the applicable ordinances detailed above.

ENHANCED SAFETY OPTIONS

Additional safety countermeasures may be selected alone or paired with other countermeasures to enhance safety in the corridors beyond those recommended in the RSA. These countermeasures include:

- Speed Mitigations
    - Reduced Speed Limit (25 MPH) in Primary Residential Areas
    - Narrow Driving Lanes to 10 feet
    - Intersection Gateway Treatments
    - 8-inch Edge Line Lane Striping
- Left-turns from Right-lane (Vice Versa)
    - Install Thru-Left and Thru-Right Combo Arrow Pavement Markings
    - Solid White / Double Solid White Center Stripes on Intersection Approaches
- Red Light Running
    - Reflective Signal Head Backplates
    - Advanced Vehicle Detection and 'Red Protect' Operations
- Additional Safety Features
    - Bicycle Lane Buffer
    - Vertical Elements in Bicycle Lane Buffer
    - Green Bicycle Conflict Area Paint
    - Daylighting on side streets to define intersections

This section describes these countermeasures. Figure 67 depicts a typical section concept showing several enhanced safety countermeasures.

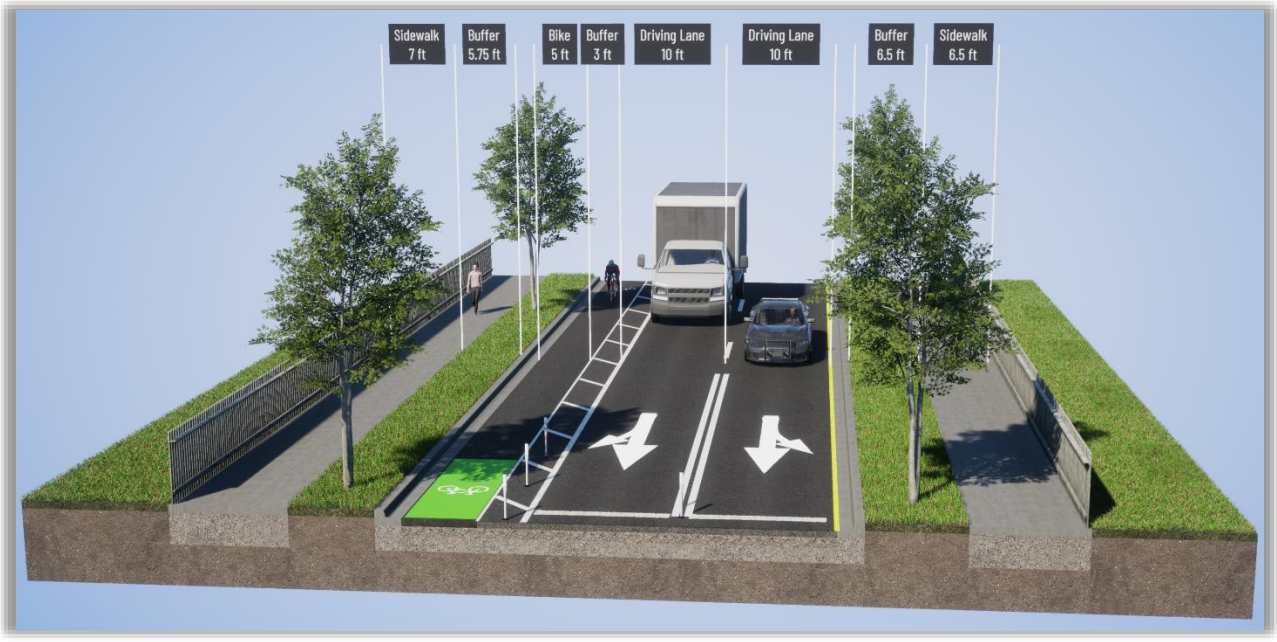


Figure 67: Typical Section w/ Enhanced Safety Features at Intersection Approach

Speed Mitigations

Reduced Speed Limit (25 MPH) in Primary Residential Areas

Lowering the speed limit to 25 MPH may reduce the kinetic energy involved in a crash on Lead and Coal Avenues; this is subject to speed limit compliance by motorists. By slowing vehicles down, motorists have more time to react to unexpected situations, increasing their ability to avoid crashes. Lower speeds also reduce the required stopping distance, minimizing the risk of collisions. The combined effect of reduced impact force and increased reaction time makes the lower speed limit critical in creating safer roads for everyone. Reducing the speed limit is low-cost and can be implemented quickly. Still, it should be considered with other countermeasures since arbitrarily lowering the posted speed limit will not yield the desired impact on driver behavior.

Dynamic Speed Feedback Signs

Dynamic Speed Feedback Signs include radar that captures and displays the approaching vehicle's speed. They may be solar-powered, which can reduce the cost of powering the sign. However, it is recommended that consistency in the placement of the Speed Feedback signs be maintained to prevent speeds from rebounding once the signage ends. Figure 68 depicts the configuration of a Speed Feedback Sign.

Figure 68: Speed Feedback Sign Configuration

Narrow Driving Lanes to 10 feet

Lane width and motor vehicle speed are related. Narrower lanes aim to slow vehicle speeds and increase speed limit compliance. As shown in **Figure 69**, narrower lanes tend to reduce vehicle speeds at a rate of 3 MPH for every foot reduction in driving lane width[1].

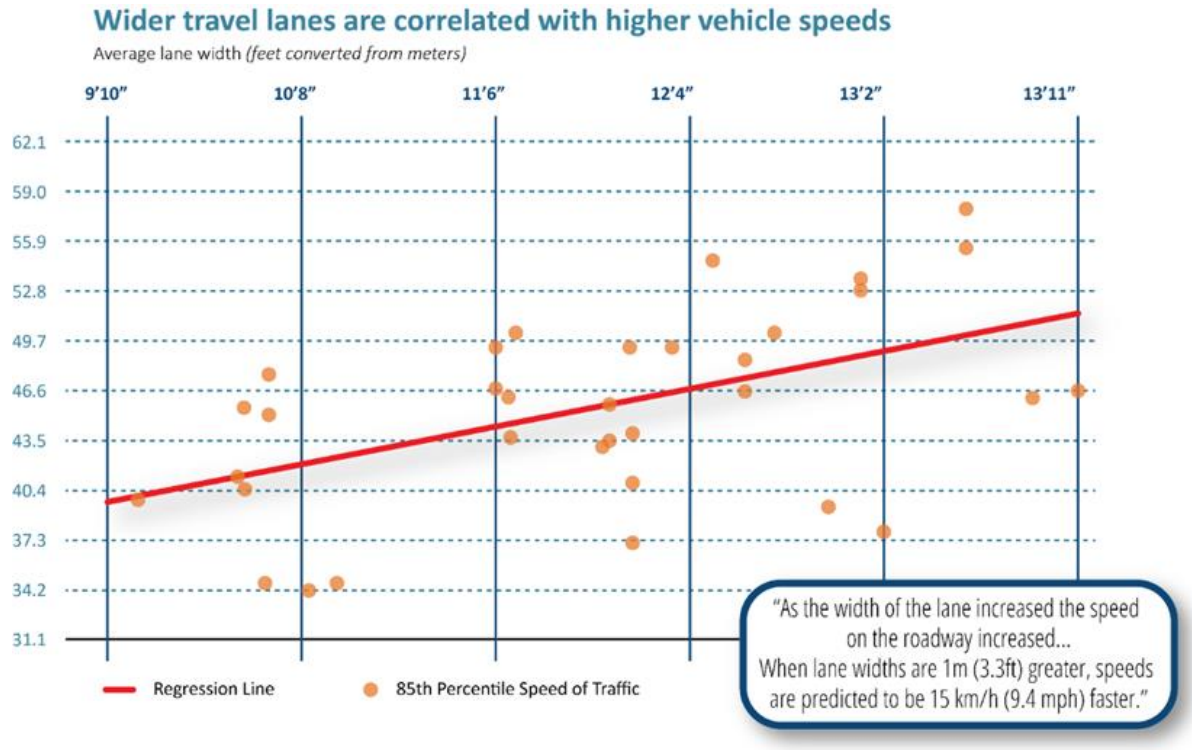

Figure 69: Average Lane width by 85th Percentile speed– Adapted from https://nacto.org/wp-content/themes/sink_nacto/views/design-guides/retrofit/urban-street-design-guide/images/lane-width/wider-travel-lanes-graph.png

Intersection Gateway Treatments

Delineator posts are vertical elements that guide motorists or restrict the travel path. They may include a strip of reflectorized plastic to increase visibility in low-light conditions. For the Lead and Coal corridors, vertical elements may encourage motorists to slow down by adding to the road's visual friction and highlighting the lane's narrowness. Additionally, they create a perceived barrier to crossing the centerline. This measure aims to create a safer environment by encouraging more cautious driver behavior. Vertical centerline elements contribute to a safer road environment by calming traffic and discouraging unsafe vehicle maneuvers. Motor vehicles often damage vertical elements and may lead to undesirable maintenance costs.

6-inch Lane Striping

Wide lane striping can aid driver awareness and emphasize roadway delineation by enhancing the visibility of travel lane boundaries. Lane striping with a six or eight-inch width is considered wide. They can provide a safety benefit to all facility types. Additionally, wide lane striping may provide better guidance for autonomous vehicles. Furthermore, wide lane striping may increase the narrow

[1] Fitzpatrick et al., "Design Factors That Affect Driver Speed on Suburban Arterials."

appearance of a travel lane. To distinctly demarcate the bicycle facility, wide striping is recommended between bicycle lanes (and bicycle lane buffers) and motor vehicle lanes, and to highlight intersections, wide lane striping is recommended at unsignalized intersection approaches.

Left-Turns from Right-Lane (Vice Versa)

Install Thru-Left and Thru-Right Combo Arrow Pavement Markings

Thru-left and Thru-right combo arrow pavement markings on a one-way street enhance safety by guiding motorists on their permitted movements, minimizing confusion and potential conflicts at intersections. These markings help prevent last-minute lane changes by communicating the allowed vehicle movements. Additionally, they may reduce the risk of sideswipe and rear-end collisions by ensuring predictable driver behavior.

Solid White / Double Solid White Center Stripes on Intersection Approaches

Solid /Double solid white center stripes at an intersection approach may enhance safety by delineating the traffic lanes. These markings help maintain predictable and organized traffic flow by reinforcing lane geometry. They also improve driver awareness by visually reinforcing an intersection and the need to be in the appropriate for the motorists' desired movement designated lane as they approach the intersection. By preventing erratic lane shifts, this striping may contribute to a more predictable driving environment, enhancing safety for all road users.

Red Light Running

Reflective Signal Head Backplates

Reflective signal backplates enhance the visibility of traffic signals, making them much easier to see, especially under low-light conditions. Think of them like high-visibility vests for traffic signals. By catching and reflecting headlight beams, they grab a driver's attention sooner and highlight an upcoming intersection. This extra visibility reduces confusion and the likelihood of red light running. Ultimately, this countermeasure can make intersections safer for motorists, pedestrians, and bicyclists by improving traffic signals' clarity and conspicuity. This countermeasure is one of FHWA's Proven Safety Countermeasures that may reduce all crash types by up to 15%[2].

Advanced Vehicle Detection and 'Red Protect' Operations

Advanced Vehicle Detection and 'Red Protect' operations can enhance signalized intersection safety by using technology to detect approaching vehicles and adjust traffic signals accordingly, reducing the likelihood of red-light running and crashes. Advanced vehicle detection can extend the green duration for vehicles that may be forced into sudden stops, preventing rear-end crashes. It also prioritizes cross-traffic and pedestrian safety by ensuring signals respond dynamically to current traffic conditions. The 'Red Protect' feature enhances safety by holding the red light for conflicting movements when a potential hazard is detected, reducing the risk of side-impact or T-bone collisions. These technologies may create a safer environment by minimizing unexpected conflicts.

[2] Sayed, T., Leur, P., and Pump, J., "Safety Impact of Increased Traffic Signal Backboards Conspicuity."

Additional Safety Features

Bicycle Lane Buffer

The corridors' existing conditions include bicycle lanes. Enhancing the existing facilities with a buffer and reducing the travel lane width would provide additional separation from motor vehicles.

Vertical Elements in Bicycle Buffer

Vertical elements can be used to highlight conflict points at intersections.

Green Bicycle Boxes

Green bicycle box pavement markings highlight conflict points at intersections.

Daylighting on side streets to define intersections

Daylighting refers to removing visual obstructions such as parked cars, signs, or overgrown vegetation near intersections, crosswalks, and driveways to improve visibility between road users. Daylighting treatments on local streets that intersect with collectors or arterials can act as a gateway treatment and communicate a transition between road environments, encouraging slower turning speeds and tighter curb radii. Daylighting may be accomplished using paint and post or curb extensions. Daylighting may aid with speed limit compliance and create a safer road environment on minor street north and south approaches at Lead and Coal Avenues.

COST ESTIMATES

Lee Engineering completed a preliminary cost estimate for each scenario and an additional Enhanced Safety Option. Each scenario includes the work required, coordination costs, and a 20% contingency. Table 27 summarizes the cost for each option.

Table 27: Cost Estimates

Scenario	Segment	Cost
Speed Reduction	1	$30,000
	2	$40,000
	3	$40,000
	Grand Total	**$110,000**
Single Lane Operation	1	$175,000
	2	$340,000
	3	$510,000
	Grand Total	**$1,025,000**
Single Lane Operation from Yale to Washington	1	$0
	2	$0
	3	$580,000
	Grand Total	**$580,000**
Two-Way Operation	1	$685,000
	2	$1,020,000
	3	$1,100,000
	Grand Total	**$2,805,000**
Enhanced Safety Option	1	$195,000
	2	$370,000
	3	$560,000
	Grand Total	**$1,125,000**

Speed Reduction

Additional signage, speed feedback signs, and rubber curb segments are costs associated with reducing speed. The total for all three segments is $110,000.00.

Single Lane Operation

Costs associated with reducing to one lane include striping, additional signage, speed feedback signs, channelizer posts, rubber curb segments, and minor street daylighting. The total for all three segments is $1,025,000.00.

Single Lane Operation from Yale Boulevard to Washington Street

Costs associated with reducing to one lane from Yale Boulevard to Washington Street include striping, additional signage, speed feedback signs, channelizer posts, rubber curb segments, and minor street daylighting. The total for all three segments is $580,000.00.

Two-Way Operation

Costs associated with converting into a two-way operation include striping, additional signage, speed feedback signs, channelizer posts, rubber curb segments, additional traffic signal mast arms and adjustments, and minor street daylighting. The total for all three segments is $2,805,000.00.

Enhanced Safety Option

Costs associated with the enhanced safety option include restriping, additional signage, speed feedback signs, channelizer posts, rubber curb segments, and construction costs. The total for all three segments is $1,125,000.00. Although this option is separate from the rest, many features can be added to other alternatives to further enhance safety in the Lead and Coal corridors.

SUMMARY STATEMENTS

This study was completed to supplement the 2022 Road Safety Audit (RSA) conducted by the Federal Highway Administration (FHWA). The RSA identified 19 recommendations to enhance safety; four initiatives were advanced and formed the foundational scope used herein.

This report is provided to the Lead and Coal Working Group, which was established in November of 2022. The data and analysis provided herein aim to aid in decision-making by residents, the Mayor's administration, the City of Albuquerque's Department of Municipal Development, the District 6 City Councilor, and the Albuquerque Police Department.

This study builds on the RSA by providing a detailed analysis of the four initiatives:

- Reducing the Posted Speed Limit to 25 MPH,
- Single-lane Operation,
- Two-way Operation and a
- Noise Assessment.

This report documents the study's findings to guide the Lead and Coal Working Group in making informed, data-driven decisions about the future of these corridors. As such, this report is not intended to provide recommendations but to provide insight into the pros and cons of the alternatives, provide additional crash data insight, and prepare cost estimates for the Lead and Coal Taskforce and the encompassing Working Group's use. A decision matrix tool was developed to assist the Taskforce and Working Group in reviewing the alternatives, as shown in Table 28 below.

Stopping short of recommendations, the project team offers the following insights:

- Speed reduction most applies to the residential areas west of the I-25 and east of Yale.
    - A speed reduction from I-25 to Yale is viable, but the trade-offs in connectivity to the hospital and university areas should be recognized.
    - The Speed Reduction Alternative can be blended with other alternatives.
- The Single Lane Alternative from I-25 to Yale degrades to unacceptable levels for vehicle Level of Service (delays) and Queuing.
    - The Single Lane Alternative provides the most significant impact and opportunity to benefit Bicycle and Pedestrian Levels of Traffic Stress.
- The Two-way Operation alternative is the most expensive and complex to implement. Considerable improvements would be required at the I-25 interchanges and the Washington Street junction.

- The Noise Assessment concluded that commercial and heavy vehicles are not significant contributors to the noise level. Restriction on heavy vehicles would likely not provide noticeable benefits.
- Opportunities exist to implement proven safety countermeasures beyond the alternatives presented in the RSA to improve safety for all users.

Tim Brown, PE, PTOE
City of Albuquerque
Traffic Engineering Division

Re: Lead and Coal Studies, V3

Mr. Brown:

Lee Engineering (LEE) is pleased to offer this proposal to complete evaluations for the Lead and Coal Avenue corridors. The scope of services presented in this proposal is based on our understanding of the needs of this project(s).

PROJECT UNDERSTANDING

It is our understanding that the City of Albuquerque is working with Lead and Coal Avenue stakeholders to evaluate safety alternatives for the corridors.

Tasks in the Basic Services contain project management and pieces of the project that pertain to multiple Initiatives. These include further corridor comparison crash analysis, project coordination meetings, and project documentation.

Additional study initiatives include:

- Speed limit reduction and other treatments,
- Reducing the number of lanes,
- Converting Lead and Coal Avenues to two-way streets, and
- Completing a noise assessment.

SCOPE

BASIC SERVICES

Crash Comparison and Trend Analysis

To further explore the Lead and Coal Avenues crash data and trends, additional studies will be completed to evaluate other comparative arterials throughout Albuquerque. The focus of this endeavor will be to compare crash rates based on volumes and roadway streetscape conditions. Included in the analysis will be comparisons across the CABQ Modified High Fatality Injury Network.

An additional evaluation will be completed to research the relationship between crash rates and increasing traffic volumes.

Public Meetings

Lee Engineering will conduct three public meetings. The meetings will generally be formatted to complete an initial introduction and information gathering meeting, then a presentation of preliminary findings meeting, followed by a presentation of the final recommendations meeting.

Lead and Coal Working Group Support

Lee will attend the ongoing monthly working group meetings. Lee Engineering will inform the group of the study's progress. Lee will gather comments and questions regarding the update and research to give feedback to the group.

Project Documentation

Lee will document the selected study options within a Project Report. Study procedures, data, and findings will be documented.

INITIATIVE 1. POSTED SPEED REDUCTION AND OTHER SPEED TREATMENTS

Lee Engineering will complete a feasibility and impact analysis of reducing the posted speed and other speed treatments.

To evaluate the reduction of the posted speed limit to 25 mph, Lee Engineering will complete a level of service and capacity analysis for the corridor. Base traffic volumes will be established through 27 turning movement counts at all the signalized intersections on Lead and Coal Avenues from Broadway Boulevard to Washington Street. Intersection performance metrics will be reported using Synchro for the existing 30 mph speed limit and a 25 mph speed limit scenario.

Lee Engineering will complete a best practices and literary search regarding posted speed limit reductions and agency experience. The focus of the research will be on before and after speed compliance and crash effects.

Along with the speed limit reduction options, Lee Engineering will explore alternative speed reduction treatments, including but not limited to gateway treatments, wide striping, narrowing lanes, landscaping, and strategic retro-reflectivity.

Additionally, Lee Engineering will investigate reports of drivers turning from the wrong lane and explore potential mitigation treatments. Lee Engineering will project crash impacts based on any available crash modification factors and engineering judgment.

Recommendations will be accompanied by a preliminary implementation plan and cost estimates for the implementation.

INITIATIVE 2. REDUCTION TO SINGLE-LANE

Lee Engineering will evaluate the feasibility of reducing the number of lanes on Lead and Coal Avenues to 1 in each direction.

Lee Engineering will collect turning movement counts for Lead and Coal Avenues as well as Lomas Boulevard, Central Avenue, Garfield Avenue, and Gibson Boulevard.

Lee will complete a field visit to confirm the existing intersection and lane geometry and signal phasing.

Traffic diversion will be estimated by balancing travel times and delays amongst the corridors.

Measures of effectiveness (MOE) will be estimated using Synchro traffic software. The reported MOEs will include vehicle delays and level of service. Included in the analysis will be a left-turn operations analysis.

No analysis will be completed for future scenarios as the project area is near full buildout.

Lee Engineering will project crash impacts based on any available crash modification factors and engineering judgment.

Recommendations will be accompanied by a preliminary implementation plan and cost estimates for the implementation.

INITIATIVE 3. CONVERT TO TWO-WAY OPERATIONS

Lee Engineering will evaluate the feasibility of changing the corridor to two-way operations on both Lead and Coal Avenues. The analysis will also estimate the traffic diversion and impacts on other corridors. Lee will complete a field visit to confirm the existing intersection and lane geometry and signal phasing.

Lee Engineering will collect turning movement counts for Lead and Coal Avenues as well as Lomas Boulevard, Central Avenue, Garfield Avenue, and Gibson Boulevard. Traffic diversion will be estimated by balancing travel times and delays amongst the corridors. Measures of effectiveness reported will include vehicle delays and level of service. Traffic diversion will be estimated by balancing travel times and delays amongst the corridors.

Measures of effectiveness (MOE) will be estimated using Synchro traffic software. The reported MOEs will include vehicle delays and level of service. Included in the analysis will be a left-turn operations analysis. No analysis will be completed for future scenarios as the project area is near full buildout.

Lee Engineering will project crash impacts based on any available crash modification factors and engineering judgment. Recommendations will be accompanied by a preliminary implementation plan and cost estimates for the implementation.

INITIATIVE 4. NOISE ASSESSMENT

Lee Engineering will complete up to ten noise level measurements throughout the corridor. Each of these measurements will be compared to the FHWA Guidance for roadway sound levels and mitigations.

Lee Engineering will document the impacts of persistent noise levels versus nuisance noise levels. Lee Engineering will document standard noise mitigation techniques and discuss the pros and cons of each.

Lee Engineering's 2023 roadway volumes, speed, and classification counts will be documented. Specifically, the truck volumes will be extracted for use and discussion.

Lee Engineering will research and document the City's noise level ordinances and options for enforcement. Lee Engineering will research and document options for truck restrictions. Cost estimates will be prepared for applicable mitigation options.

If you have any questions, please contact me at (505) 338-0988. Thank you for the opportunity to conduct this Study on your behalf, and I look forward to working with you on this Project.

Sincerely,

_____

Paul Barricklow, PE, PTOE

Subject: Re: Lead and Coal Public Meeting 3 Slides
Attachments: DOWNTOWN-Walkability+Analysis.pdf

Hi Paul & Team,

Unfortunately, I couldn't make it to the December public meeting, but I just reviewed the slides and have some comments. Maybe some of them can be addressed in the report.

- For the speed studies (slide 15-18) can you also calculate/plot the **85th percentile** speed? It could be an additional horizontal line.
- In our working group meeting you had shown **Pedestrian LOS** (e.g. based on signal timings). These were not in the final slides. I hope these are presented in the report.
- For the **Queuing study**, it would be good to have an indication of how often the queuing condition occurs. If it only occurs for one hour, during peak hour, it might be a good trade-off to accept some queuing for enhanced safety and walkability throughout the day. Similar for the vehicle LOS (are these based on the worst conditions? how often do those conditions happen?)
- On slide 32, does going to a single lane configuration really increases the **travel time** from 2.5 minutes to 12.5 minutes? Seems unrealistic to me. At that point I would assume drivers would look for alternate routes. But also, if this only happens for 10 minutes a day it might be acceptable.
- Thank you for including the **pedestrian LTS.** The single-lane configuration does the best at reducing the LTS, but it would still remain mostly at LTS 3. Two comments:
    - In the report it would be good to discuss/recommend what would be needed to get the entire (or most of) study area to LTS 2
    - Are you sure LTS was calculated correctly? From the Existing Conditions details on slide 57, the sidewalk width is 8', and the buffer (buffer + bikelane) is 9', which would suggest LTS of 2. (But also, I don't think the sidewalks are 8'... from my calculations they are closer to 6.5')
- In our working group, you mentioned that with the **single lane configuration** drivers might misuse the large buffer. I just want to point out that this has been done successfully in Albuquerque (on Lead & Coal nonetheless!). On the bridge over the railroad tracks, Lead has a 13' buffer (from a previous lane reduction I'm guessing). The proposed 10' buffer is feasible.
- There are a few things to note for the stretch **west of the highway** (Huning Highlands, my neighborhood)

    - The newly adopted bike plan calls for protected (vertical separation) bike lanes west of the highways and assigns this a "high priority". This should be incorporated into the proposal.
    - While you only showed a single road profile for the entire study area, west of the highway the road width is 30' (compared to 25' east of the highway). There might be more room to play here, e.g. to go to two-way traffic with a two-way cycle track.
- I appreciate all the work done for the **"enhanced safety" option**, and think many of those elements should be used even for the one-lane or two-way configurations. However, I still believe maintaining two-lane one-way configuration will not be sufficient to truly enhance safety.
    - I am attaching the Albuquerque Downtown Walkability Analysis done in 2014 by Jeff Speck. On page 18 he argues against 2-lane one-ways: "*Drivers tend to speed on multiple-lane one-way streets, because there is less friction from opposing traffic, and due to the temptation to jockey from lane to lane. In contrast, when two-way traffic makes passing impossible, the driver is less likely to slip into the "road racer" frame of mind.*"
    - Personally, I would prefer to solve this problem once and for all, even if it means having to wait to secure some additional funding (e.g. two-way conversion is significantly more expensive). One option is a two-way conversion west of the highway to continue the downtown configuration, and the one-lane option east of the highway where the right-of-way is narrower and would not support two-way bike lanes.

Thanks again for this great work and presentations. I'm looking forward to seeing the report!

Best,
Carlos

Subject: Feedback: Followup Questions I/IV

In advance of the January 29 Lead Coal Task Force meeting and your preparation of a draft study report, I am submitting several questions.

Please respond in email, and, if necessary, in the meeting.

I request, also, that these questions be included in public comments for the study.

Most of these questions have been raised in previous communication. If you have previously replied, please refer me to those responses.

In order to help track these questions, I will be submitting them in a series of separate emails.

Follow Up Question I: Road Departure/Off Road Crash Reporting

1. Will you be reporting road departure/off road crash data in your report for the study?
2. If so, what is the basis for any data on Lead-Coal or elsewhere in Albuquerque? APD and DMD have previously reported in the LC Working Group that they did not/do not collect this data on accident reports.
3. Is there, then, reliable road departure/off road crash data (historical or ongoing) for APD/DMD, or not?

Subject: Followup Questions II/IV: Cross Street Driver Behavior

1. Is the study measuring or compiling data on cross street driver behavior?

2. Specifically, is the study measuring or bringing forward previous data on north-south speed across signal intersections?

3. The intersections with greatest risk of high speed collisions onto sidewalks and into adjacent homes are the signal intersections (at Stanford, Girard-2, Bryn Mawr, Carlisle-2,Wellesley and Columbia). What do we know, in total, about north-south driver behavior as a factor in collisions at these locations (speed, red light running)?

4. Do your proposals for mitigation include any measures directed at north-south driver behavior?

Subject: Followup Questions III/IV: Noise Data

1. What, as precisely as possible, was the location of noise meters? How many feet from the roadway?

2. In large part because of signalization, traffic flow and traffic noise on Lead-Coal (in my area) follow a relatively tight wave pattern: a pulse of traffic and noise followed by a period of quiet. If the reported noise averages capture both active and quiet periods, then the intensity of noise exposure as a platoon moves past will be under measured. Can you (or the noise consultant or a third party) go back into the noise measurements, confirm this phenomenon, and correct for it?

3. Peak vehicle noise is probably greatest at and immediately downstream of signal intersections. What was the location of the noise meters vis-a-vis traffic signals?

Subject: Lead-Coal Washington to Yale: vertical and horizontal curves [Filed 12 Sep 2024 11:51]

Categories: Filed by Mail Manager

Hi Paul,

I've had the chance to look at the slides from the Lead-Coal meeting last week.

I was encouraged to see that your slide on area characteristics includes (roadway) curves.

The Washington to Yale section is notable for several curves, both horizontal and vertical. Especially in combination with the narrow ROW and shallow side setbacks, these curves create easily predictable and identifiable sightline deficits.

I encourage you and your team to evaluate some of these locations including how the approach of two unidirectional travel lanes affects sightlines.

Horizontal curves

Coal and Harvard: crossing south to north from SE corner
Lead and Montclaire: crossing south to north from SE corner
Lead and Solano: crossing south to north from SE corner

Vertical curves:

Coal and Hermosa: crossing south to north from SE corner
Lead and Amherst: crossing south to north from SE corner.

As I explained in my public comments, the Washington to Yale section has both site-specific (the above examples) and generalized sightline limitations. For notable examples of the generalized problem, I suggest your team look at:

Coal and Cornell: crossing north to south from NW corner
Coal and Columbia: crossing south to north from SE corner.

Thanks for your team's work so far.

If you can confirm receipt of this email and of my public comments from last week I would appreciate it.

Joseph Aguirre

>
> Nicole, Paul,
> I want to update you on a discussion I had with the resident who had the signal light projected into his yard during the crash with serious injuries and which projected a signal light into his yard. The resident is a mature, intelligent young man who has lived there for years. I asked him how many road departure crashes had he observed at that intersection over the past year. His response was at least five as serious / violent as the one sent you two. He described them as follows:
> - One vehicle departed the road and took out the light/signal pole on the southeast corner.
> -Another multi-car crash hit the wall in front of his house sending a cinder block flying just inches from his head. He was working on his car in his own front yard!!
> - Still another multi car crash caused him to go out his front door upon hearing a thunderous crash to be confronted by a yelling / screaming woman asking him to help her remove her trapped infant from her car. He was able to extract the child as the vehicle began to emit heavy smoke. It should be noted that his eyes watered up as he told me about this incident. He went on to say how sad to think that the trauma would probably occupy the mother and child's thoughts for many years to come!
>
> Be advised, this intersection has RIR installed! Also just a couple blocks west is the only ASE Camera in the corridor!
> When one considers the number of serious road departure crashes at this intersection in the past year (AND AFTER RIR and speed camera were installed), it is going to take actions on the order of one lane travel with speed reduced to 25 MPH in order to protect private property, residents and infrastructure!!

Subject: Coal and Girard: still dangerous for anyone near the roadway

2,472 days since we advised Mayor Keller about the countless crashes onto our sidewalks and into our homes, Coal and Girard, and the other signal intersections from Washington to Yale, remain dangerous for anyone near the roadway.

From Eli Sanchez's conversation with the resident at the SE corner of Coal and Girard:

> "The resident … has lived there for years. [O]ver the past year [he has seen] at least five [crashes] as serious / violent as [October 1].
> - One vehicle departed the road and took out the light/signal pole on the southeast corner.
> -Another multi-car crash hit the wall in front of his house sending a cinder block flying just inches from his head. He was working on his car in his own front yard!!
> - Still another multi car crash caused him to go out his front door upon hearing a thunderous crash to be confronted by a yelling / screaming woman asking him to help her remove her trapped infant from her car. He was able to extract the child as the vehicle began to emit heavy smoke."

Some question and requests for Lee Engineering and DMD:

1. Please bring the crash report from the October 1 event to the next working group meeting. If you can, provide it to the group in advance.

Do we know if speed was a factor in this event? If so, for the vehicle(s) on Coal or for the vehicle(s) on Girard?

2. What do we know about speed on the higher volume north south streets from Washington to Yale (Carlisle, Girard, Columbia, Stanford)?

What do we know about speed on these streets as a factor in high impact crashes at the high risk signal intersections as these streets cross Coal and Lead?

3. What more about speed on north-south streets will we learn from Lee's ongoing study?

4. Slide 13 from Lee's Sept 5 presentation presents crash rates for "off roadway" events on Lead/Coal and the comparison streets.

Is "off roadway" the same as "road departure"?

If so, my recollection from working group meetings was that APD was not systematically collecting road departure data? Is my recollection correct, or not?

So, is the off roadway data for Lead/Coal meaningful or not?

5. It's fully reasonable to conclude that it's unsafe to operate signal intersections on LC from Washington to Yale. The ROW is too narrow and homes are too close to the curb. So, it's regrettable that traffic circles are not one of the current alternatives for consideration. In its final report, Lee should at least comment on whether traffic circles are an option for later consideration.

If you wanted to walk along Coal Avenue or Girard Boulevard with your family -on your way to Nob Hill or to UNM- would you feel safe standing at the SE or NE corner of Coal and Girard?

Thanks for your attention.

Joseph Aguirre

Subject: LEAD COAL STUDY QUESTIONS

Paul, Estela,

In reviewing the slides and comments from the last public meeting, I have some questions / concerns. Seems we are all in concurrence that there exists no comparable roadway in New Mexico to reference this study to. That is progress!

Having said that, we would like to also fully capture / retain focus on the history of how this roadway's use has resulted in the 5 decades old problem that exists today!

Concern / questions are: (1). When reference documents are used to compare such things as crashes, excessive speeds, as is being done in your slide presentation, how exactly are you factoring in the fact that this residential street is being used as a main arterial roadway. One can easily conclude that this corridor was intended, engineered and built as a residential street. In it's use (misuse) as a main arterial and seeing the serious numbers of dangerous road departure crashes, serious roll over crashes, infrastructure / private property damage that has occurred (over 700 in a four year period), it would be shocking to conclude that this corridor is safe for future use in it's current form. (2). How do your metrics factor in the extremely narrow set back distances to homes and private property? These set backs are as narrow as 15ft. (3). When will your study collect speed data on Lead/Coal east of Carlisle? This section of roadway has been neglected as it relates to Rest in Red (RIR) and Automated Speed Enforcement cameras (ASE) tools and the excessive speeds and reckless driving behaviors seen daily reflect this lack of enforcement coverage!

We look forward to hearing your responses at the next task force meeting.

Respectfully sent, Eli Sanchez

Subject: FEEDBACK ON LEE ENGINEERING SLIDE PRESENTATION FOR PUBLIC MEETING SCHEDULED FOR 14NOV2024

Paul, Stephen and Estela,

1. Included are questions/comments on your proposed slide presentation for the upcoming public meeting. I apologize for my wordiness (just me). Comments / Questions as follows:

- If you were to compile data from Washington to Yale vs Washington to Broadway, how would that affect the findings of your study?
  I ask this because the width of roadway west of Yale is wider and much more accommodating to a higher level of service and speeds.
- How would the data change by using reference tables from Highway Safety Manual and Highway Capacity Manual and apply them to crashes within the Washington to Yale roadway only?

2. My reason for asking these questions are:
- The "Corridor" in which the very serious road departure crashes, rollover crashes, property damages AND 5 fatalities have occurred happened between Washington and Yale.
- Citizen concerns expressed in emails, phone calls, and public meetings have addressed dangerous conditions requiring immediate attention in the roadway between Washington and Yale on Lead/Coal.
- Formation of the working group was requested and formed to address dangerous crashes within this corridor.
- The working group with CABQ leadership has invited participation from outside the Washington to Yale corridor with no interest shown. This has also been true for the on going study.
- Again, it should be noted that the roadway west of University on L/C are much wider, even allowing for roadside parking. Stated simply, the most dangerous portion of this roadway is between Washington (Montclair) and Yale. That section of roadway is significantly narrower and home, property and sidewalk offsets are very much less.

3. Also noted were questions related to slides:
- "Additional Speed Data on Lead / Coal from RIR" slides all (except Lead-Buena Vista) clearly show a complete lack of drivers observing the posted speed limit of 30 MPH. That fact is particularly significant when speaking of a narrow residential roadway with a clear history of dangerous crashes!
- Your "Crash / Vehicle Volume " slides should NOT be used in anyway to imply or claim that what they show is acceptable progress!

One hundred and seventy five crashes (info taken from 2013) is the fewest number of crashes shown on your graphs. That is a hell of alot of dangerous crashes in this narrow, short distance roadway!
- Seven hundred ninety six (796) crashes in the last four year period of data should further demonstrate how reckless / irresponsible it is to consider this roadway (in it's present configuration) to be safe! These numbers came from the information you are using in your presentation.

4. I look forward to your written response to these questions/ concerns. Respectfully sent

Subject: Someone is going to get killed

Dear Mayor Keller, COO Montoya, and DMD Director Turner:

These photos at the NE corner of Coal and Cornell yesterday 12:55 pm.

Countless high impact crashes at this intersection, many onto the sidewalk.

Dangerous sidewalk. Dangerous intersection. Dangerous road. Reckless operation. This is the - what you appear to consider - "normal" consequence of operating a principal arterial on a narrow residential side street.

A pedestrian is going to get killed here. A student on their way to UNM. A senior citizen on their way to Smith's. A family on their way to Saggios.

Keep your cars on the road where they belong.

Yeah, the boulders helped keep the car out of that front yard. What kind of city makes residents build their own perimeter defenses in order to keep their homes and families safe?

Joseph Aguirrre
Spokesperson, Lead Coal Safety Brigade

Subject: Lead/Coal feedback

Thank you, Ms. Gabaldon and everyone from Lee Engineering, for presenting at the community meeting on December 18. I enjoyed learning about the various ways data has been collected and the possible options for improving safety and noise pollution in the Lead/Coal corridor.

At the meeting I asked how we actually decide on the options that we would like and was told to give feedback. So here is that feedback! :)

First Choice: Enhanced Safety Options - Single Lane (Protected Bike Lane),
Slide 72.

Second Choice: Enhanced Safety Options - Single Lane, Slide 71.

Third Choice: Enhanced Safety Options - Enhanced Safety Options, Slide 69.

Here are the reasons I prefer these options in this order:

I used to live in a place that required a car to go everywhere, and I moved to Columbia and Coal specifically because I want to walk or ride my bike to my daily activities. And I do actually walk all over my neighborhood to stores, restaurants, UNM and CNM. I also take the ART and ride my bike. I hardly ever drive my car. So my preference is to make my neighborhood safe, reducing accidents and noise and air pollution. As a pedestrian I find it much safer to cross a one-way street, and one lane is easier to cross than two. It is also safer and quieter when there is less traffic and when that traffic is slower. Twenty-five mph or slower is ideal. Possible traffic delays are not important to me and I would be happy if we could reduce vehicle traffic as much as possible and/or spread it more evenly across all our neighborhood streets because it is currently too concentrated on Lead and Coal. I love the idea of bump-outs to make north-south streets narrower at the intersections, such that car traffic has to slow down a lot to turn onto them. Also, I cannot in good conscience allow my teenager to use the bike lines as they are today: they need to be separated from car traffic, and that car traffic needs to be much slower!

I am very much NOT in favor of two-way traffic on Lead and Coal. It will be expensive and make crossing streets trickier than it is now.

Thanks again for your time and efforts. Have a great holiday!

Looking forward to a quieter and safer new year,

Rose Pezzuti Dyer

Dear Mr Barricklow:

Lead and Coal Studies Public Meeting Feedback: stay focused

Please accept the following, and the referenced attachment, as public comments of record for the ongoing Lee Engineering *Lead and Coal Studies.*

My comments are in response to your November 14, 2024 Lead Coal public meeting.

I encourage you in the remainder of your study and in your study report to stay focused on where and what the problem is that you have been engaged to work on. The problem is the dangerous crash conditions alongside our homes on Lead and Coal Avenues from Washington St to Yale Blvd. Your effort must focus on making this section of the roadway safe for the families who live, walk, and bike along it.

Please understand that it is the sustained effort of families along this roadway section, in response to those conditions, that has led to your study.

Our families' effort was responsible for City of Albuquerque (CABQ) Mayor Tim Keller's 2018-2019 Lead Coal Task Force. During that process we recommended (and received broad support - including from NMDOT- for) a Federal Highway Administration (FHWA) Road Safety Audit (RSA) on Lead Coal from Washington to Yale. In October of 2019, after initial opposition, Department of Municipal Development (DMD) Director Pat Montoya ordered the FHWA to conduct the RSA we had recommended. Despite having been promised by the Mayor himself, the RSA was killed 2 months later, before it had even started, with never an explanation.

It was our continuing effort that then led to the June 2022 FHWA Lead Coal RSA. (As a "pedestrian-focused" study, it appears to have been structured deliberately to deny and avoid a look at *road* safety conditions along the corridor.)

And it was our families that called, successfully, for the creation of the (fall 2022-November 2024) Mayoral Lead Coal Working Group, whose purpose was to implement recommendations of the RSA. As you of course know, it was the Working Group process that resulted in your Lead and Coal Studies, charged to evaluate several of those recommendations.

Finally, please be aware that it was our families that asked our state legislators to support our effort on Lead-Coal and that it is their capital outlay dollars which now fund your study. That funding was always for and about the dangerous conditions on our section of Lead-Coal.

There are two problems with Lead-Coal from Washington to Yale. The immediate problem is the road itself. DMD is operating a principal arterial on narrow residential side streets. I've previously pointed out to you in detail the many obvious road safety conditions, both generalized and location specific. This should need no explanation. Of course the road is dangerous. Of course it's substandard.

The second problem is the operation of the roadway. DMD, and a series of Mayoral administrations including the current, have, over decades, been indifferent to how harmful it is to operate a principal arterial on only 60 feet of right of way, with traffic just 15 feet away from our homes.

So while our families see block after block of explosive crashes onto our sidewalks and into our homes; while we see rollover crashes into our front, back and side yards; while we see ejection fatality and pedestrian crash victims in front of our living room windows and brain matter on our streets and in our yards, what has DMD said, forever? "Nothing to see here.Your crash rates are fine."

A heads up, then, to you, Albuquerque Vision Zero, DMD, the Mayor, and the Mid Region Metropolitan Planning Organization (MR-MPO): if the crash conditions on a street make the people who live along it justifiably afraid to exist in their homes or stand in their yards or walk on their sidewalks, something is deeply wrong. *If you can't see that this is wrong because your crash statistics say there's no problem, well, clearly the problem is your use of statistics.*

So, Lead Coal is not, then, just another generic traffic calming problem. Consequently, as I've said before, it's unclear whether your conventional analysis and methodologies are relevant here. *You need to focus not on where else cars might go if CABQ does what's needed to protect us, you need to put a stop to where the cars are going now: across bike lanes, onto sidewalks, and into our homes.*

In addition to staying focused on what and where the problem is, I encourage you to be cognizant of your obvious built in bias here and to avoid unconsidered endorsement of what DMD is doing. Because *what our DMD has been doing on Lead from Washington to Yale –for decades– is beyond harmful. More of the same is not ok. Your job is not to "make it work." Your job is to make us safe.*

Instead of more of the same, it's time for thoughtful consideration of just what is reasonable to expect of our streets. *It's time for the Mayor and DMD to get real. They need to create a safe traffic plan for the narrow, residential side streets they have, not the high speed high volume*

roadway they wish they had and that DMD failed to build when they spent $32M to fix Lead Coal.

Also, I encourage you to avoid any appearance that your intention is to obfuscate what has happened on Lead-Coal. CABQ's actions on Lead-Coal, over decades, do, indeed, give the appearance of obfuscation and cover up even. You don't want to be perceived as enabling any such effort.

In that regard I'm providing as an attachment to this letter the 2010 NEPA document for the Lead and Coal Avenues Improvements Project (LCIP). The officially documented purpose of LCIP was to fix the crash problem that we are still dealing with. That's not what DMD told the USDOT and until explained otherwise, it appears this is how DMD evaded a road safety study for the project.

So, stay focused on what and where the problem is. And remember that even though DMD may be cutting the check for the Lead and Coal Studies, and for your next on-call project for them, your duty is to the public and specifically to the families who have made your study possible and who have made very clear what your study needs to be about.

Below is an image of the most recent high impact crash onto the sidewalk at the NE corner of Coal and Cornell. Be sure in your images for this project to include photos that exemplify the countless crash scenes like this outside our homes. You don't want to give the appearance of minimizing our problem.

Sincerely

Joseph Aguirre
Spokesperson, Lead Coal Safety Brigade

Attachment: Lead and Coal Avenues Improvements Project, 2010 NEPA document (in cover email) Alb Lead and Coal CE.PDF

Cc: Lee Engineering project staff; Mayor Tim Keller; City Councilor Nichole Rogers; DMD; state legislators; community members

Photos below: NE corner of Coal Avenue and Cornell Drive, December 2, 2024. Each crash like this risks injury and death for pedestrians on their way to the nearby University of New Mexico, Smith's supermarket, or Saggio's pizza. You don't need a pedestrian level of service or a threat index to see that this sidewalk -like, for the same reason, sidewalks all along Lead-Coal from Washington to Yale- is dangerous.

Question 2	If you answered No to the previous question, tell us your thoughts.				
Question 3	What are your thoughts on the study?				
Question 4	Do you want to be added to an email list for this project?				
Question 5	If you answered Yes to the previous question, please provide your name and email.				
No.	**Question 1**	**Question 2**	**Question 3**	**Question 4**	**Question 5**
1	No	Too many people weren't paying attention to what Greg said at the beginning (and what Don said at the end—that in order to enact ANY of the RSA recommendations, a traffic study was required	I was also confused by the data presented	Yes	Patricia Willson info@willsonstudio.com
2	Yes		I live between Lead and Coal. I am concerned about the safety aspects of a development planned for the corner of Silver and Wellesley, one block' north of Lead. It will be a 40 unit complex, with up to several bedrooms. In January 2023, the architect said that entry and exit to the property would be through the alley. If cars enter or exit this alley onto Lead, that will be hazardous since cars fly down the hill to try and make the light at Wellesley. Please contact the developer, Rex Cohen (rexcohen12@gmail.com), to get clarification. If this is not in your scope of work, please let me know who help clarify this. Thank you.	Yes	catherine.hubbard@gmail.com
3	Yes		I think some of the comparisons were flawed and should be discarded. More credible data, such as qualitative data from residents, should be used to inform decisions instead.	Yes	Carlos Michelen Strofer, c.michelen.strofer@gmail.com

Lead and Coal Studies Response Form - Public Meeting 2						
Timestamp	**Did you attend the public meeting?**	**If you answered No to the previous question, please provide your thoughts, comments, concerns, or questions.**	**If you answered yes to the first question, tell us your thoughts on the presentation material.**	**What kind of improvements would you like to see on Lead and Coal**	**Would you like to be added to an email list for this project?**	**If yes, please provide your contact information.**
2024/11/14 7:47:06 PM MST	Yes		Lots of data. Slides not super legible	Slower speeds, less traffic	Yes	info@willsonstudio.com
2024/11/14 7:48:27 PM MST	Yes		Great, clear info	Lower speed limit	Yes	maggie20silva@gmail.com
2024/11/14 8:43:13 PM MST	Yes		Very hard to see. But presenter well-versed.	Wow me. I don't have any major complaints with how it is now (except traffic light on Coal at CNM campus). Central is the bigger problem.	No	
2024/11/14 9:17:04 PM MST	Yes		The presentation was informative and relevant. I enjoyed it. Thanks! But the slides were difficult to see. Please make figure labels, etc, much larger font and visible colors. Better projector if possible.	One lane per direction: either one-lane one-way, or two-way conversion. Geometric changes to reduce speed: narrower lanes for sure, but also some of: traffic circles, curb extensions, raised sidewalks, etc. If one-lane one-way option: protected bike lane with low level of stress throughout the whole corridor and low level of stress at the intersections.	Yes	c.michelen.strofer@gmail.com
2024/11/14 9:35:21 PM MST	No	As a concerned Burqueno and someone who has lost family members lives to cars this city needs to do something about how our roads encourage drivers to speed, be reckless, and careless as they drive. It is cruel and unjust that as pedestrians and cyclists we must do everything correct: Wear high visibility clothing every night, do not listen to music, stay as close to the curb as possible, make eye contact with drivers through dark tinted windows before crossing and merging. All this so that drivers can be dangerous and careless behind their 2 ton death machines. Then when they eventually harm and kill people - the victims are always blamed for not doing more to protect themselves. So I have to comment, I have to speak up and go on the record at every opportunity and pleas to our city officials to stop building roads that kill us		Make these roads one way and 1-lane with a focus on geometric changes to calm drivers (e.g., narrower lanes, curb extensions, speed bumps, traffic circles, etc.) and physical barriers on bike lanes to protect cyclists and pedestrians. Our bodies don't come with air bags and crumple zones; painting lines is a very weak suggestion that drivers to pay attention and stay in their lane.	Yes	BryanDombrowski3@yahoo.com
2024/11/14 10:30:32 PM MST	No	a friend (who attended) gave a brief overview of meeting		slowed traffic, safer for bikes and pedestrians (protected bike lane) - a single lane might also help reduce the number of people turning the wrong way onto these roads - i see this all the time. better configuration for bikes crossing at I-25 (especially heading west)	Yes	sito.org+leadcoal@gmail.com
2024/11/15 2:38:28 PM MST	Yes		Material was very good but presentation of f it was difficult to see.	Slower/less traffic	Yes	Abqmetzner@gmail.com
2024/11/16 9:16:20 AM MST	Yes		It was a very informative presentation. I wasn't sure what to expect and was pleasantly surprised. A little more up front explanation of the goals of the work would be nice. I think many people would be interested in this information and would like to see more neighborhood participation. I just happened to be on Nicole Roger's email list (thank you very much to our new city councilor-good start!). I will be informing as many people as I can about the next meeting.	It seems like slowing down the traffic would do a lot to reduce the noise. I would walk on those streets more often if they weren't so noisy.	Yes	pfmetzner@gmail.com
2024/11/21 8:21:45 PM MST	No	My family is very happy the noise and lack of safety on Lead and Coal are being taken seriously. This corridor should be a quiet residential area and not an alternative highway. Would love to be able to ride in a safe and separate bike lane and get some relief from the noisy car traffic. Please include the corner of Columbia and Coal in your improvement plans!		Stop through traffic like at Columbia/Santa Clara. If that is too extreme, discourage the amount and noisiness with narrow lanes, speed bumps, traffic circles, or other physical barriers. Lights and signs are not enough to force drivers to slow down. Would also love a separate bike lane with barrier.	Yes	rose@dyer.me
2024/12/18 7:56:05 PM MST	Yes		Very good presentation, especially section on Enhanced Safety Options	While I appreciate Dr. Aguirre's comments about support for single lane option, I am very concerned about the impact on Garfield with that option	Yes	Already on list
2024/12/18 9:27:03 PM MST	Yes		Thanks for putting together the presentation! I'm concerned that more engaged community members are having an outsized influence on the project. Repeatedly, I heard that bicycle safety was not a priority. That might be true for the people in the room, but I think the neighborhoods have more diverse opinions. The people with time to engage in numerous public meetings and stakeholder engagement groups are not a representative sample of the constituency impacted by the study. Maybe just take their input with a grain of salt...	The enhanced safety measures were very thoughtful and potentially impactful ideas. In particular, I thought the bike lane delineators would help calm traffic, while adding additional protections for cyclists. The daylighting idea could be implemented with street side basins where runoff from streets could be used to water native vegetation. This would increase shade, decrease runoff, buffer noise, and calm traffic. Check out Tucson where they have adopted water harvesting chicanes throughout the entire city. The Silver Avenue Bike Blvd stops at the interstate (i.e., it suffers from a lack of connectivity). This is a big opportunity to better connect Nob Hill to downtown and the Rio Grande for cyclists.	Yes	justincjohnson2@gmail.com

Lead and Coal Studies Response Form - Public Meeting 3					
Timestamp	**Did you attend the public meeting held on December 18, 2024?**	**If you answered No to the previous question, please provide your thoughts, comments, concerns, or questions.**	**If you answered Yes to the first question, tell us your thoughts on the presented material.**	**Would you like to be added to an email list for this project?**	**If yes, please provide your contact information.**
2024/12/19 1:15:17 PM MST	Yes		I recommend the single lane option from Yale to Washington. It would be cheaper than trying to do the whole L/C corridor. It would be safer for pedestrians and cyclist, would eliminate drag racing, plowing down of trees and running up on sidewalks and into houses,walls, fences and peoples front yards. I'm sure there will also be a reduction in speeding.	Yes	tomsimic323@gmail.com
2025/01/06 2:01:06 PM MST	No	We operate a delivery business located on Lead. It is our opinion that reducing the flow of traffic to one lane in each direction would significantly and detrimentally impact our business operations. We are opposed to this proposal.		Yes	mike@advantage-av.com
2025/01/06 2:19:48 PM MST	No	I operate a warehouse on the corner of Elm and Lead all the way south to the corner of Elm and Coal. I live in the international district and routinely travel on Lead/Coal to get to and from work and to service my clients with n the surrounding area. There would be nothing but trouble in making Lead and Coal two way roads. The congestion would be astronomical and people would stop traffic to pull across lanes to get into their driveways and adjacent alleyways causing more accidents and more traffic. Homes sheltered on the leeward side would become victims of potential accidents. It doesnâ€™t even take an engineering firm to see that. What we need is better traffic control and more police presence. Chicanes might work, lane narrowing as well, but people speed and drive recklessly because there is no repercussion. How many unpaid speed cameras tickets are out there? And would we sacrifice some of the most used bike lanes for this pipe dream?		Yes	Kyle@certifiedusa.net
2025/01/08 8:24:54 PM MST	Yes		Solid presentation. Would have liked more stats showing that, despite the apocryphal stories, the stats show that there is not an unusual amount of speeding or crashes along Lead and Coal. Please do not make changes to a well-functioning thoroughfare, especially without consulting other neighborhoods that use Lead/Coal as a pass-through. Instead, it can be made safer through speed enforcement, clear striping and barriers in key places. Rest-in-red has already contributed to making it safer.	Yes	ja.montalbano@gmail.com

RE Lead and Coal Studies: Road Safety and Standard of Care

As you head towards concluding the Lead and Coal Studies, I recommend that you make clear -and make clear in your final report- what the scope of work is regarding any examination of the safety of the Lead-Coal roadway (ie “road safety”). I also recommend that you make clear to the community what any relevant engineering standard of care may be regarding the need for a road safety study in this matter.

As I understand the scope of the Lead and Coal Studies, it does not look at whether the Lead-Coal roadway is safe: not in its entirety, not for any section, and not for any site-specific location.The study is blind to the question. It appears to assume, without stating such, that the roadway itself is safe.

If this is the case, then, I recommend you not represent in the study report that you have looked at the safety of the roadway. Your look at “comparable” roadways or your singling out of any specific feature of Lead-Coal between Washington St and Yale Blvd and citing that the same feature is found in other settings (for example that “homes on Indian School are also 15 feet away from the roadway”) does not constitute a road safety study.

If the current study does not itself look at the safety of the Lead-Coal roadway, I encourage you to refer to any previous examination of road safety, including -and specifically- for the section from Washington to Yale. In my 20 year experience as a citizen advocate for Lead-Coal no such study has ever been done.

Moreover, not only has a road study never been done, the City of Albuquerque (CABQ) and the Department of Municipal Development (DMD) have repeatedly evaded a road safety study of Lead-Coal: in the $32M federally funded Lead and Coal Avenues Improvements Project (safety document 2010); in the $120M federally funded Albuquerque Rapid Transit Project (safety document 2015); in Mayor Keller’s December 2019 cancellation of an already requested FHWA

Road Safety Audit (RSA) on Lead-Coal from Washington to Yale; and in the 2022 FHWA RSA which, as a “pedestrian” audit, precluded any look at conditions of the roadway.

It is demonstrably unsafe to operate a high volume, high speed roadway -to operate two lanes of busy traffic whether unidirectional or bidirectional- on our narrow residential side streets. If it is safe –if there’s nothing to hide– why has CABQ repeatedly evaded a full, unbiased look at road safety as a factor in the crash problem on our roadway section?

If the current study is not looking at road safety and there is no previous road safety study to refer to, you are then necessarily constrained in the scope of your final report. Your analysis must focus on and clearly state to what extent any mitigation measure will do what the FHWA to its credit made clear in its 2022 report is the purpose of this exercise: make Lead and Coal Avenues safe for the people who live, walk and bike alongside them. Or, to express that purpose in the vernacular: keep the damn cars on the road.

1. Absent a road safety study, you have no basis to conclude that for the roadway from Washington to Yale (the section of intense community concern since January 2018) the current traffic configuration –or even its tweaked, “enhanced safety” version– is safe. Again, it is demonstrably not.

2. Absent a road safety study, you have no basis to conclude that the bidirectional option would be safe, or safer than the current configuration. A priori, the significant sightline obstruction present all along the Washington to Yale section would be as bad or worse in a bidirectional configuration.

3. You do have a basis to conclude that the single lane option would, by many factors, best protect the safety of residents, pedestrians and bicyclists 24/7/365 along the Washington to Yale section.

4. Absent a road safety study, you have no basis to refute or dismiss the FHWA’s conclusion that a 25 mph speed limit -of course, strictly managed- is indicated to keep the cars on the road. And, you have no basis to refute the sustained, and well substantiated community recommendation for a 25 mph speed limit in the Washington to Yale section.

So, please, clarify your scope and adhere to it. You may reasonably acknowledge the absence of a road safety study. I strongly suggest you do so in your report. You may not imply that the roadway is safe and that the demolition derby outside our homes is just on the drivers. And, the conclusions in your report must be laser focused on what measures will work best to keep residents, pedestrians, and cyclists safe.

Finally, Lee Engineering (in this study) and DMD (in its decades long management of crash safety on Lead-Coal) give the appearance of treating a critical crash safety problem without an adequate diagnostic examination. What is the relevant engineering standard of care here? When is a “road safety” study indicated?

We all look forward to putting the Lead-Coal matter to rest, finally. Beyond a definitive safety solution, that will necessitate learning why it has taken CABQ decades to fix the problem. If a road safety study should have been done decades ago, the community deserves to know that.

Thank you for your work.

Sincerely,

Joseph Aguirre

Intersection Summary

Intersection Signal Delay (s/veh): 54.3 Intersection LOS: D
Intersection Capacity Utilization 77.2% ICU Level of Service D
Analysis Period (min) 15
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

Intersection Signal Delay (s/veh): 56.7 Intersection LOS: E
Intersection Capacity Utilization 55.6% ICU Level of Service B
Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary	

Intersection Signal Delay (s/veh): 30.5	Intersection LOS: C
Intersection Capacity Utilization 71.2%	ICU Level of Service C
Analysis Period (min) 15	

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary	
Area Type:	Other
Cycle Length: 91	
Actuated Cycle Length: 91	
Offset: 22.5 (25%), Referenced to phase 2:EBT and 6:WBT, Start of Green	
Natural Cycle: 80	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 0.31	

Intersection Signal Delay (s/veh): 5.2	Intersection LOS: A
Intersection Capacity Utilization 39.8%	ICU Level of Service A
Analysis Period (min) 15	

Splits and Phases: 19: Cornell Dr & Central Ave
